Yahoo Group Archive: APRS (1998 — 2006)

Yahoo Group summary: APRS: Automatic Packet Reporting System

These Yahoo Groups messages were archived in WARC format by ArchiveTeam in 2015. This PDF was generated by Digital Library of Amateur Radio & Communications from the WARC files in 2026.

Date span: 1998-08-14 through 2006-12-31

Source WARC: yahoo-groups-2015-10-27T05:40:25Z-wf01ac.warc.gz

Source item: https://archive.org/details/yahoo-groups-2015-10-27T05-40-25Z-wf01ac

Messages included in this PDF: 3992

Message records with no body available in the source archive: 1

Messages omitted as spam from this PDF: 9

Yahoo replaced the domain portions of email addresses with @... in the archived messages. Characters lost in Yahoo's archived text appear as ?.

Messages are presented in ascending Yahoo message-ID order. Gaps indicate records absent from the source WARC or messages omitted from this PDF as spam.

1. Backup list

Yahoo group: APRS (1998 — 2006)
Date: 1998-08-14 21:48:46 UTC
From: Ray Vaughan
Topic: 1 Message: 1

I hope this doesn't upset anyone, but I've set up a back up APRS mailing list. A company called OneList (http://www.onelist.com) has set up a real nice mailing list front end. I've set up quite a few lists with them.

I started a list for APRS. To get on it, go to:

http://www.onelist.com/subscribe.cgi/aprs

It will walk you through the steps.

PLEASE, do not think of my list as a replacement for the TAPR list. Think of it as a place to as "Is anyone else not getting messages?" Or "Is the list down?" If the TAPR list is down for a while, I guess we could move there, but ONLY until TAPR is back up. It is NOT my intention to replace or compete with the TAPR list.

I also manage these other list subjects on OneList:

nextel, repeaters, grms, soflahams, broadcast, thebox, barryuniversity, wvum, irc, video, emergency, hamradio, aprs, cabletv, nocode.

Ray, KD4BBM

2. Traffic in the new lists

Yahoo group: APRS (1998 — 2006)
Date: 1998-08-17 15:01:46 UTC
From: Ray Vaughan
Topic: 2 Message: 2

Welcome to the list!

I know some of you are wondering, 'well, I signed up, where is everyone?'

Well, as the list manager, I can tell you a lot of people have signed up, but no one is talking yet. I was expecting this. Everyone is always shy, afraid to say the wrong thing. Well, get over it! Go ahead and start a message, mention something, and lets get some good threads going.

OneList is fairly new. So far, it looks good, but I start to wonder if there will be more lists than users! I'm sure everything will work out. But, the quality of the list is not how many are on it, it's about what they're saying. It may take a couple months to get a steady flow of messages going.

Please pass the word about this list to your friends, co-workers, anyone that might be interested in the topic.

If at all possible, please post an answer or response to the list. That question you're answering might be on the minds of a few people. Let's all learn from it.

I hope we can all start learning real soon.

Ray Vaughan, List Manager.

3. An update

Yahoo group: APRS (1998 — 2006)
Date: 1998-09-01 21:14:29 UTC
From: Ray Vaughan
Topic: 3 Message: 3

It's about time for another message from the manager...

These lists are growing, slowly. I ask you to please stick around. Things will get busy once OneList catches on. Right now I know many of you are too shy to say something... you're waiting for someone else to start a thread. Well, get over it! Start a message. Give us an opinion releated (even slightly) to the list's subject. I'm sure someone will repsond, and that will get the flow going.

So, who's going to break the ice?

Ray Vaughan, List Manager.

4. aprssig@tapr.org

Yahoo group: APRS (1998 — 2006)
Date: 1998-09-16 20:32:42 UTC
From: Ray Vaughan
Topic: 4 Message: 4

It's possible that the TAPR reflector is down again. They've been working on it a lot the last week. I haven't seen a message in at least 24 hours.

A reminder: This list is a BACK-UP for the main list. If anyone has anything urgent to get to some of the APRS active hams, this list might help. Feel free to post something.

Once the main TAPR list is back up, do NOT post here.

Thanks.

Ray, KD4BBM

6. Monthly message

Yahoo group: APRS (1998 — 2006)
Date: 1998-10-10 04:06:10 UTC
From: Ray J. Vaughan
Topic: 6 Message: 6

Here's this month's message from your friendly mailing list manager ;)

I really want to thank you all for joining these lists. The number of people on some of these lists is really impressive. Others are still a bit slow to get popular.

But here's the problem: On some of the lists, you're being too quiet! There are a lot of people here that are ready to help, or be helped. All it will take is a few questions to get things going. Please don't be shy. Just jump in and say something! Take a moment to intro yourself and tell us why you're here and what you hope to learn or teach.

Thanks for being a member of these lists. Please pass the word and tell a friend.

Ray, List Manager

7. Regular message from the moderator

Yahoo group: APRS (1998 — 2006)
Date: 1998-11-18 17:32:06 UTC
From: Ray Vaughan
Topic: 7 Message: 7

I would like to thank all of you for subscribing to one or more of the lists I moderate on OneList. My apologies if this message reaches you more than once.

Some of these lists have caught on like wild fire, others have yet to get any threads started.

I urge you to start a conversation. State an opinion about the subject. See who agrees. See who disagrees and why. I'm sure everyone will learn something in the process.

A mailing list is only as good as it's participants. If you think things are slow, you're as responsible as anyone for the lack of messages. If you give it a try, I think you'll find that it's very rewarding to be active in a mailing list.

For those of you who have been active, Thanks! For the most part, everyone has been very polite and there's been little if any need for me to get involved. That's great.

If you would like to join some of the other mailing lists I moderate, check out http://www.gate.net/~rvaughan/mailing.htm for descriptions of the lists.

One housekeeping note: Onelist needs to expand the system again. There will be some downtime tonight from 6PM to Midnight Pacific (US) time. No messages will be lost, but they'll be delayed while the changes are being made.

Thanks,

Ray

Always happy to hear that a new digi is on the way!

Just so you know, this list is only a backup for the real APRS sig. Sometimes that list goes down for hours at a time, so I set up this list to be a spare for the real list. To sign up for the real one, go to www.tapr.org.

Thanks,

Ray, KD4BBM

Welcome to APRS! I would love to see some stations in the UK.

However, this is the back up list to the one at TAPR. There's really
nothing done on here. Instead, please go to:

http://www.tapr.org/cgi-bin/lyris.pl?enter=aprssig&text_mode=0

That will let you sign up for the REAL APRS list. It's VERY active. Right
now, APRS is THE hot thing in ham radio. There's a lot of other APRS
information on the www.tapr.org site too.

Have fun.
Ray, KD4BBM

13. APRSdos Uk maps

Yahoo group: APRS (1998 — 2006)
Date: 1999-03-17 10:59:04 UTC
From: Revd Jim Butterworth
Topic: 13 Message: 13

I have recently loaded various versions of APRS and am experimenting with them - not registered yet until I have evaluated the usefulness.

Problem with DOS version - I have downloaded the Uk maps but don't seem to be able to get them to load when running the program.

The prog initially says it is using maplist.apr and loads and displays the europe map - I can fix my position OK on this

If I then use MCC to change to maplist.eur and hit home it loads the Pacific map !!

I would love to get this running and encourage others to use APRS but I'm stuck at present on DOS - Can anyone help??

14. HELP with APRS+SA

Yahoo group: APRS (1998 — 2006)
Date: 1999-07-25 17:11:32 UTC
From: muldoon@xxxxx.xxx
Topic: 14 Message: 14

Hi all!

I am brand spankin' new to APRS, so here is a chance for all of you to get yer licks in at a newbie! While there is some APRS activites in Iowa, there is nobody even close to me using it. So I need some help to get it running.

I downloaded the latest APRS+SA, and have Street Atlas 6.0. However I am having a BUNCH of problems with questions to match:

1. APRS+SA will not start SA from the Command item on the menu. Did I not set something up right?

2. If I start SA myself, ASPRS+SA will not put the right icon on SA when I enter my position and tell APRS to show me on the map.

3. Is there a manual to this thing that I have missed?

That should be enough to fill my mailbox for awhile. With the state of the packet BBS network these days being what it is, I want to do something worthwhile to justify my contining packet operations. I run a FBB BBS with 4 VHF ports at 1200 baud and a UHF port at 9600 baud. I also operate a ROSE node into the Iowa Communications Network statewide fiber optic system, so I am not a "newbie" to packet, just to this software. I am really more interested in the APRS+SA rather than WinAPRS or APRSdos because of the maps.

Any help will be greatly appreciated!!

Michael G. Muldoon, KE0BX

Hi ALL.....
I am using WinAPRS v 2.4.5 My monitor is set up
600/800 Tru color 32 bit. When I bring up the program
and go to DISPLAY to bring it down, it comes down but
half of it is off the left side of the screen. I have
been using these settings a long time and run dozens
of other Windows programs with out a problem.
I wrote Mark Sproul about the problem and he said to
go to the WINDOWS menu/RESET WINDOWS LOCATIONS.
I have tried this and nothing happened.
Please help.... Bob wh6dx

Topic: 17 Message: 18

First of all, a reminder for everyone.... this is only a backup list for the real one at TAPR. This also serves a place to distribute files which can't be done on that list.

Mark's suggestion was exactly what I was thinking. Other than that, I'm not sure what to suggest. I assume you're registered so the settings stick. Without that, I don't think anything will you change will stick. Any chance your ini files are read only?

Subject: [Kenwood] The NEW Kenwood/VHF/UHF
Date: Tuesday, May 23, 2000 06:04

This is a description of the NEW Kenwood HF/50/144/440/1200 MHZ rig.

The bands it covers.....

10-160 meters 100 watts
50-54 MHZ 100 watts
144-148 MHZ 100 watts
430-450 MHZ 50 watts
1240-1300 MHZ 10 watts ALL MODES
This radio has TWO separate receivers.....

1. The main band uses IF DSP and uses all modes
2. The sub band uses AF DSP and uses AM/FM modes only

The sub band receives 118.000- 174.000, & 220- 512 MHZ.
These are some examples of what you may see in your display...

HF/144
HF/ 440
1200/144
1200/440
50/144
50/440
144/144
144/440
440/440
440/144

3. This radio is a full functioning Satellite rig using IF DSP
4. Built-in Automatic antenna tuner that covers 10-160 meters.
5. Built-in 1200/9600 baud TNC
6. Built-in Kenwood Sky Command (HF Remote control with a TH-D7A, &
TM-D700A)
7. Built-in DX Packet Cluster Monitoring

Example when you are listening to 20 meters in the main band you have the 2 meter DX Cluster frequency in the sub band with the TNC engaged if a DX spot comes up the FREQUENCY/ UTC TIME/ AND THE DX STATIONS CALL SIGN WILL SCROLL ACROSS THE SCREEN. If you have the menu set a AUTO this information with get transferred to the main band automatically...
WOW !!!!!!!!!

8. External RX antenna connection (for a beverage antenna)
9. Built-in Electronic Keyer
10. Large Amber LCD display has a slanted aero dynamic look, and all the front panel buttons are BACK-LIT in darkness you may see all the keys, and their functions.
11. Built-in Preamplifier
12. Built-in CW Auto Tune
13. Beat Cancel
14. 5 antenna ports
15. Direct RS-232 port on the rear panel, you do not need to buy any external interface unit to connect it to your PC, its just a snap DB-9 to DB-9 straight cable that's it...
16. You may use the Kenwood RCP software to control the rig.
17. It is a 12 volt unit and uses the same mobile bracket as the TS-430S, 440S, 140S, 680S, 690S, 450S, 570D/S

THIS RADIO COMES IN THREE CONFIGURATIONS...

1. The complete radio with the nice LCD amber display
2. The "Black Box" with no display, in this case you may use the RCP software to control the radio with your PC
3. You may also use the Black Box and connect the REMOTE DISPLAY for use in your car. It is small and compact like the Kenwood TM-D700A remote display.
4. You may also use the complete radio and use the Remote Display in your car.

The radio is NOT FCC type accepted, it does not have a model number, estimated price, or delivery date hopefully it may be available at the end of the year.....

You can provided you have the G version of firmware. (Should show (G) on powerup.
It's also in the manual update which I believe is in PDF form on the website.

The very first and most important thing to do is make
sure your computer is talking to your tnc.
once you are sure that is happening then unzip and run
the Winaprs program.
Go to the settings dropdown menu and start at the top
and set every setting in the first group. some are
default and others are information you must provide.
The absolute best way is to find a mentor in your area
and sit down with them and learn.
this is a somewhat involved process and hard to
explain in an email or over the radio or LL.
Hope this gave you some insite.

Topic: 37 Message: 39

I am running APRS+SA on my base station and I have a tracker and a portable station. I would think APRS+SA would be the most popular since there are no maps to make and the precision is so great. I can even tell which lane of a 4 lane road the tracker is on since selective availability has been turned off. Also the voice feature is great allowing computer use in the car without taking your eye off the road.

41. Looking for a GPS for my D700a or...help

Yahoo group: APRS (1998 — 2006)
Date: 2000-07-15 04:22:59 UTC
From: William "Hawk" Bennett
Topic: 41 Message: 41

Hello,

I am sorry for cross-posting this question, but I would like to maximize the possibility of getting an answer.

I have the Kenwood D700a & bought the necessary cables to attach my Magellan Tracker to the radio (data/power cable with loose wires). I have been very unsucessful getting the lines to match up & getting the items to "talk" to each other.

The D700a has a DATA IN (from GPS-red), DATA OUT (to GPS-white), & GROUND (shield).

The Magellan Tracker has a POWER (red), GROUND (black), NMEA+ (orange), Data+ (yellow), Alarm (white)

No matter which I hook up, & configure the GPS, I can not get them to "talk".

SO, the "real reasons" for this message:
How to get them to talk or
What inexpensive GPS will talk to the D700a sucessfully (tried & true)?

42. Re: [APRS] Looking for a GPS for my D700a or...help

I did it, I didn't have any problems. You have to have a MODEM cable, not your hotsync cable to go into the com port on the D700. Palm does not have a modem cable any more, mine was/is from a 3rd party vendor.

I will check and see if I can find the name of the place I got it if you need it.

From: Daniel Bartlett
Topic: 48 Message: 48

Hi Everyone,

I have just produced the October Issue of StuckButton. It is a FREE online magazine, produced monthly, for amateur radio enthusiasts, and anyone can write articles for it, or get photos published etc!

Why not check it out at http://www.egroups.com/group/stuckbutton? It is in pdf format, so you will need Adobe Acrobat.

Thanks,

Dan Bartlett, VK4TDB

49. APRS shines at WX Symposium

Yahoo group: APRS (1998 — 2006)
Date: 2000-10-10 13:23:17 UTC
From: Mary Joseph
Topic: 49 Message: 49

Lots and lots of folks got exposed to APRS at the Severe WX symposium on Oct 7 in Lincoln, NE. A balloon was launched that contained an aprs transmitter, GPS and a simplex repeater. The Skywarn Amateur Radio Association was tracking the balloon from the symposium. It was
a lot of fun and put APRS and Ham radio in the spot light!

Here is a link to the Lincoln Journal Star review of the Saturday symposium

http://www.hprcc.unl.edu/nebraska/oct8ljs.html

50. Operating through MB7U** calls in the UK

Yahoo group: APRS (1998 — 2006)
Date: 2000-10-10 21:54:12 UTC
From: mike adams
Topic: 50 Message: 50

The MB7U** IGATES can be operated through as follows

How to make use of I-Gate ☐ MB7UAN ☐ in Andover, Hampshire -
also
applies to other UK I-Gates

When MB7UAN has its Internet gateway open you will see the other MB7callsigns on your map from around the UK. At the moment I am only sending beacons from UK MB7calls out on RF as I receive thousands of stations from around the world on my Internet port and this would flood 144.800 if I was to transmit them all! I will review this in the future as you may like to see some callsigns from around the world.

This is how it works.

When MB7UAN gateway is open your beacon, if heard by my station, will automatically be sent out on the Internet worldwide. As long as I can hear your beacon your signal will be sent out onto the Internet. This means that you may then be called by a station somewhere in the world who has seen your beacon. If you do get a call then the response will come via the internet back to me and out on my radio port via the digis you used to get to me. It follows the same path in reverse. So you never know you may get a call!

When you know the gateway is open you can click on any MB7 gateway and then use the following commands to query them on the Message screen. Before you will get a response I must have received a beacon from you or heard your beacon even if I am not in your beacon path. Press F9 in ui-view to force a beacon. This will tell my system the route to reach you.

On the MESSAGE screen

In the TO Box type the callsign of the MB7 station

The Port should stay as 1 (the same as it normally is for uiview activity)

In the DIGI Box use the normal route to get to me ☐ as I will be
gating your signal. So for example if you use G1SEH to reach me ☐
leave G1SEH in the digi box. You do not need to include my callsign.

In the Message box type the following commands to query the station. The query is only sent once so if no response after a while then sends it again. You must have an X in the APRS box on this screen.

The following commands can be sent: (Please note use CAPITAL letters)

?PING? Sends a PING query to see if the station is live and can hear you

?APRSD This will ask the MB7 station to send you a list of stations it can hear on its radio port

?DX This will ask the MB7 station to send the most DX station it has heard on its RF port

When you get this list you can then try to work one of the stations. Simply put the call in the To box and send a message ☐ leave the digi box alone so it still reaches me. The link should then be set up via Internet and radio at the other end. It may not always work, as the station operator at the other end may not be in the shack ☐ same rules as when working locally!

The commands mentioned above will also work with the stations on the RF port so you can always try them.

Summary

Remember ☐ you are linking by radio to MB7UAN in Andover so use the digi path to reach me at all times. The APRS box must have an X in the box and commands must be sent using capital letters. A query only works once so if no response - try again. Your beacon must have been heard by me before you will get any sort of response ☐ so make sure you have sent your beacon out to reach me. My station is also a 24hr digipeater using MB7UAN or WIDE as the digi.

If you find these instructions do not work or need further clarification please contact me and I will update.

Email: mikeadams@...

MB7UAN will be operational most days but times cannot be guaranteed. The beacon will indicate when it is open for Internet traffic and you should also see other MB7callsigns appearing on your map from around the UK. Calls to look out for:

MB7UAN ☐ Mike in Andover, Hants
MB7UAY ☐ Ian in Irvine, Scotland
MB7UEY ☐ Peter in Leconfield, East Yorkshire
MB7UIA ☐ John near Birmingham
MB7UIJ ☐ Ian in Rotherham, South Yorkshire
MB7UJI ☐ Bert in Rotherham, South Yorkshire
MB7UUI ☐ Andy in The Rock, Telford
MB7USA ☐ John in Widnes, Cheshire
MB7USK ☐ Matt in Folkestone

MB7USS ☐ Bob in Rotherham, South Yorkshire
MB7UPG ☐ Ciemon, JO02LC
MB7UIV ☐ Keith, nr Clacton on Sea

If you run an I-Gate and are not on the list, or have suggestions how to improve these instructions ☐ please let me know.

73 de Mike G0AMO ☐ Sysop MB7UAN

APRS+ is still available. You can download it from
http://www.tapr.org/~kh2z/aprsplus/ . Latest version appears to be
compatible with SA versions 4,5,6, and 7. I bet 8 is not too far behind.

57. gps

Yahoo group: APRS (1998 — 2006)
Date: 2000-10-31 22:49:34 UTC
From: Jim M Wedlake
Topic: 57 Message: 57

I'm adding a DeLorme tripmate to my KPC-3+ with 8.3 to run WinAPRS on a PC.

I'll add a DB9 for the GPS signal and gnd, 2 to2 and 6 to5.

When I force the gps to self start what will the battery life be?

Do I have to modify the tnc?

Thanks and 73, de KD4MZL in St Pete

58. Callsign Filter

Yahoo group: APRS (1998 — 2006)
Date: 2000-11-15 01:37:02 UTC
From: Bob Murdock
Topic: 58 Message: 58

Does anyone know if you can filter or exclude a specific callsign from responding to APRS? I have a local mobile running a Kenwood D700 with a 0.5 minute transmit update, who parks a few miles from my QTH and leaves the rig on for hours at a time. This causes my DOS APRS station to relay his info twice a minute for hours at a time. Since my amplifier is relay controlled, I'm concerned about all this Ker-Chunking.
73, Bob, WX2NJ

>I replace the map of the USA with one from the UK?

There are a series of maps for the UK available at TAPR. Go to:
ftp://ftp.tapr.org/aprssig/dosstuff/APRSdos/ukmaps05.zip to download it.
Unzip them using the -d switch with PkZip into your main APRS directory.
To use them, press M(aps) > C(onfigure) > C(hange maplist) and type UK,
then <cr>. 73

71. Cheap weather stations for sale at Heartlandamerica.com

Yahoo group: APRS (1998 — 2006)
Date: 2001-01-13 18:04:04 UTC
From: Simpson, Jr, Joe B.
Topic: 71 Message: 71

Heartland America (http://www.heartlandamerica.com, 1-800-229-2901) is selling the Oregon Scientific WM-918 weather station (which is exactly the same unit as the $300 Radio Shack WX-200) for $150 and throwing in a desktop NOAA weather radio to boot. The item number is S1-33501 in their January '01 catalog. (On their web site it shows up as item WW22-3350 with no mention of the weather radio.)

This kinda annoys me, since I bought mine from them for $200 and didn't get a free weather radio, but I thought I'd let the rest of you know anyway... ;-)

It's no "Davis Instruments", but this is a perfectly serviceable WX station for APRS use - and the price is right.

-joe K4SAR

B-)

I think that we've been there, and done that, for various things.

The UKainians will, no doubt tell you how the advertised price in US$ become
UK? when they get over here!

Topic: 78 Message: 78

Due to a problem of the digi causing interference with the voice repeater I have tried for a week to resolve the issue unsuccessfully and before people really got upset I felt it better to temporarily pull the plug. It will return real soon full Time I promise !!

The issue has come up with a window of 1.785 mhz separation between the APRS feq and the 146.175 repeater input the 175 doesn't like to share the coax with the digipeater. I have tried unsuccessfully to work out the issue with the duplexers that I was using.

At this time the duplexers are back in my shop and I am continuing to try my best to work the problem out.

81. problem with Precision Mapping on W98 laptop

Yahoo group: APRS (1998 — 2006)
Date: 2001-03-01 00:23:10 UTC
From: Simpson, Jr, Joe B.
Topic: 81 Message: 81

I have a Dell desktop running W98, on which I have installed WinAPRS and Precision Mapping 3.5. I was able to register pmapocx.ocx with no problem using the supplied batch file (which does "regsvr32 pmapocx.ocx").

Now I am attempting to set up the same stuff on an older IBM thinkpad also running W98, and am having trouble. When I run issue the "regsvr32 pmapocx.ocx" command I get a little box that says:

```
LoadLibrary("pmapocx.ocx") failed.
GetLastError returns 0x00000485.
--OK--
```

pmapocx.ocx is in the \windows\system directory, from which I am running regsvr32.exe.

Have any of you run into this problem before? Any advice?

Thanks...

I just purchased a DeLorme Tripmate. It was widely recommended
on the Internet as a cheap GPS for APRS use.
Obviously it needs some modification, since it starts
sending NMEA data only after sending the string "ASTRAL" back to
it.

What modifications are necessary ?
Web-Links are also welcome.

73,
Frank

86. Need Help!

Yahoo group: APRS (1998 — 2006)
Date: 2001-03-19 22:36:24 UTC
From: wb3kas@aol.com
Topic: 86 Message: 86

APRS Party People,

I am running packet with a single port PicoPacket PacComm TNC and an ICOM ht. Works great. But I want to do more.

I am trying to interface this system to a Garmin III. As best I can tell I have all the parameters set for APRS, but maybe not. I can't get past the message on the screen, "Waiting for gps data" or words to that effect. I have the interface format of the Garmin set to NMEA...but I think I may have some of the flags set wrong in the TNC for proper display of the lon/lats. Obviously, I am overlooking something simple.

If someone could just give me the list of the proper flags you are using in your TNC, I can check them with mine and go from there.

Thanks in advance.

73,

Jim Montgomery
Brandywine, MD

Hi Jim,

Sorry I don't have an answer for you, but I'm
watching the thread for other responses from
others here in the list. At this time, I'm
still looking for a decent priced GPS rcvr.
Sad that company that was selling them for
around $30 isn't doing so any more :(

Ya snooze - Ya Loose...

Also, I use MFJ's here, dumb about PacComms.

Thanks for your post.

What have you connected the GPS to? Since that TNC has no built-in
provision for GPS, you'd have to build a Hardware-Single-Port (HSP) cable. For details on this, see the APRSDos documentation README\GPS.TXT.

Topic: 89 Message: 89

I'm looking for some help setting up my KPC-3 for APRS digi operation.
I've been using the old KPC-3 for years, so I some what understand
the commands. But setting the APRS mode has got me confused. I am
wanting to set it up as a DIGI repeater to pass GPS information.
There is a DIGI 70 miles to the East and one 50 miles to the West.

91. Question about W311 and APRS

Yahoo group: APRS (1998 — 2006)
Date: 2001-03-29 21:06:33 UTC
From: Edgar McKinney
Topic: 91 Message: 91

Hi all

Is there a version of APRS that will work with the Windows version 3.11 interpter?

I have several computers some with W311. I need to use the W311 for APRS and the win version of APRS wont work. The MS-DOS version will run but I'm hoping there will be a better one for W311.

Thanks in advance

From: Dave
Topic: 86 Message: 93

Excuse the slightly off topic question, but how do you switch to 'Text' only instead of HTML?

I had a message, not from the list, which was Spam, but it kept downloading adverts like the ones that Yahoogroups now send, and I'd like tom stop them.

I have an ancient version of Eudora, which will only accept text anyway, and I don't really want to have to use it on here as well.

Thanks for the help.

de Dave (G0DJA)

PS - I've looked in the various setup menues, the only one I found was the one that means that I only send text and not HTML. I want to turn HTML messages into text, like my old version of Eudora does. Then I don't get the adverts. :o)

From: rcluster@qwest.net
Topic: 96 Message: 96

Hi Gang,

Heading to Alaska from Oregon in July for a Vacation. I have seen a few stations near Anchorage and Fairbanks make it into the findu website but haven't ever had any Alaska stations show up on my map directly (wishfull thinking??)

Anybody out there ever ran APRS up the Alaska Highway and elsewhere in Alaska, Yukon, and Northern BC? What can I expect for digi coverage?

Should I just leave the TNC at home? (GASP!!)

Any and all comments welcome.

Thanks....Ron in Eugene, OR....KB7VIR

97. KAM Plus Digi

Dunno why you're having trouble with the transmit... I am using an old KAM also and didn't have to do anything unusual to get it to work. WinAPRS does all the TNC initialization just fine without any help on my part except I think for one setting which affects the length of the incoming packets (doesn't affect xmit). Are you sure the cabling is set up correctly between the KAM and the radio? Does the xmit light on the KAM go on when you're trying to transmit?

Just a note to say that I think I got the sucker working.

I went into the TNC commands section under settings and took both the VHF and HF out of host mode. I suspect that it needed to be in kiss mode.

I can get it to transmit when I force a send position and query. It send a command to xmit in the HF port then the VHF port.

Can I get the HF port to shut down? I dont hjave anything connect to the HF rig at this time

>connect to the HF rig at this time

Tell WinAPRS that the TNC is a single port on VHF, rather than setting up as
a dual-port TNC. When you use the function key to manually send a position
or weather string it will still tryt to output to both the VHF and UHF
ports, but that doesn't cause a problem. In normal operation it will only
output to the VHF port.

>Now that im set up and running, Im slowly learning the finer points.
>What exactly does the relay and wide commands mean?
>My WINAPRS default is relay, wide.

My understanding (which is certainly prone to being incorrect!) is that RELAY means outgoing packets can be repeated by a station set up as a "relay" node. the WIDE means that after hitting a relay station, the next (and last) repeat will be WIDE stations heard by the RELAY station. Presumably a WIDE node also acts as a RELAY by default, but the documentation for APRS is so sparse that I'm really just guessing. Assuming that's correct then if a WIDE node can hear you directly then you will get two WIDE repeats of your packets. (By "repeats" I mean that every qualified node that hears a packet which still has at least one "hop" left on it will deduct one hop and repeat the packet).

A popular setting around here is RELAY,WIDE3-3 (which gives you three WIDE hops after a RELAY).

(And if anyone on the list knows how to tell APRS to configure a station as a RELAY station, please chime in because I've not been able to figure it out.)

Hi Joe

Depending on which version of APRS you are using, there is a place where you
set your 'Alias' Your alias is RELAY for a home station and you will
digipeat any reports which have the 'relay' in their path. Only digipeaters
on tall towers or mountain tops should be set as WIDE digipeaters. If you
can't find that setting on your particular version of APRS, then at the TNC
prompt, type MYAlias RELAY and that will do the same thing (That is the KPC
command and may differ for other TNC's)

108. RE: [APRS] KAM All Mode

Yahoo group: APRS (1998 — 2006)
Date: 2001-07-02 12:56:07 UTC
From: Trish & Carla
Topic: 99 Message: 108

The default mode upon power-up is based on what
has been defined in the "pmode" command.

I believe that if Pmode is not specified, then the
unit comes up in vhf packet mode.

"interface mode" may also need to be specified as
either " terminal" or "newuser" . Terminal mode is
better since the entire command set is available
for use instead of just the common ones.
"Newuser" mode keeps newbies from changing
settings that should not be changed without some
knowledge by the user of what they are doing.
sort of an "idiot-proof" mode..

Hello all,
I've just finnished my TinyTrak running firmware 1.4 and
I'd like to try it out. But I'm not quite sure how... I've just
downloaded UI-view 2.36 and would like to know a couple of things:

1. Can I use it to check if my APRS station is working while it's
unregistered?
2. Since we don't have an APRS network in my area is there a way
to check if my setup is working without going trough a digi?
3. Can I set up a temporary digi for APRS with UI-view and my Kenwood
HT TH-D7E?
4. We have only one packet digipeater in our area. What can we do
to this digi to make it relay APRS data as well as packet?

Your help is more than welcome,
YZ7REA Vladimir

Hi All
I am trying to set up an APRS combination. I have ordered a TH-D7GA
and am trying to decide on a gps receiver. I have searched the net
but I can't find any gps comparisions that adress use with that radio.
I am leaning toward the Garmin 111+. Any better? Also what kind of
cable will I need to connect the two. The QST review described one
but didnt name it.
This all looks like a lot of fun. My problem is that I dont know any
other hams involved with gps who I help me. My only info has been
from the various WEB sites. I am glad I found this group.

Peet Bros also has reconditioned gear available. On their web page there is the "Outlet Mall", but if you call them on the phone ask about other reconditioned stations. I saved about 50 dollars on the U2K. Could not tell it was reconditioned, looked brand new in the orig boxes, even had the plastic cover on the display. They have U800 on the website almost same as U2K but without barometric pressure.

I am tring to make a cable to connect the Kantronisc KPCIII plus to the ADI AT-201 handheld but haven't been very succseeful. does anybody have one that works.

118. Winaprs and the Kenwood TH-D7A - Help Needed

Yahoo group: APRS (1998 — 2006)
Date: 2001-08-03 17:11:16 UTC
From: Pete
Topic: 118 Message: 118

Hello, My name is James and I am new to this group and even newer to APRS. I just bought a Kenwood TH-D7A HT that has a built in t.n.c. and aprs software. I was able to setup all the needed information in the radio last night and begain receiving aprs, using the TH-D7A as a stand alone. It worked great, however sending a message using the keypad on the Kenwood is a pain and takes forever.

I got a hold of WinAprs version 2.4.6 and loaded it into my computer. The problem is I could not get the Kenwood to display the information it was receiving to the Winaprs software. I also went to the trouble of seting up all the parameters in the software and it would loose them everytime I exited the program. Help !

Does anyone know if the TH-D7A will interface and work with Winaprs ? If so are there any certain settings that could be causing my problems ? I know the I have the correct ports chosen and all the easy stuff because I can get the Kenwood to communicate with the Kenwood programming software? If Winaprs does not work with the KEnwood Th-D7A is there another program that will? I have no other hams in my area using this form of digital communications so I need help bad.

Thanks

James - KC0DND

you need to set the radio up in tnc mode and not aprs mode, you use your computer and software for aprs instead of the radios software.
i hope this helps

To all radio amateurs

SB SPACE ARL ARLS014
ARLS014 New Amateur Satellite to Link Remote APRS Nodes

PCSat, a US Naval Academy Amateur Radio tracking and communications satellite, is scheduled to launch September 1 (0100z) from Alaska. PCSat will augment the existing Amateur Radio Automatic Position Reporting System (APRS) by providing links to the 90 percent of Earth's surface not covered by the terrestrial network.

PCSat was designed and assembled by midshipmen at the Naval Academy in Annapolis, Maryland, to gain practical hands-on experience in support of their aerospace curriculum. The students worked under the guidance of Academy Senior Project Engineer Bob Bruninga, WB4APR--the ''father of APRS.''

''We hope that PCSat will be a new direction for amateur satellites by serving the communications needs of travelers with only mobile and hand-held radios anywhere on Earth,'' Bruninga said. PCSat will be the first satellite to report its exact position directly to users via its onboard GPS.

Bruninga said the satellite will demonstrate vehicle tracking and communication for GPS-equipped remote travelers--including Naval Academy vessels at sea, cross-country travelers, expeditions or anyone far from the existing APRS terrestrial tracking infrastructure.

In addition to its APRS capabilities, the satellite will offer 1200 and 9600-baud packet operation on VHF (145.825 MHz) and UHF (435.250 MHz). For APRS digipeating, the satellite will use the recognized North American APRS frequency of 144.39 MHz.

Bruninga said that PCSat should make a great classroom tool, since its telemetry can be received by any hand-held packet radio for display to students on their PCs.

PCSat will be one of four satellites in the Kodiak Star payload. The others are Sapphire, Starshine III and PicoSat. An Athena I launch vehicle will carry the satellites into space from the Alaska Aerospace Development Corporation's Kodiak Launch Complex. This will mark the first attempt to put a satellite into Earth orbit from Kodiak Island. The spacecraft will be launched into an 800-km circular orbit.

For more information, visit the PCSat Web site,
http://web.usna.navy.mil/~bruninga/pcsat.html .

From: Simpson, Jr, Joe B.
Topic: 122 Message: 123

"Peter" <vk1npw@...> writes:

>Can anybody out there tell me a good site that gives a good
>description of the use and differences of WIDE and RELAY..

WIDE describes a permanent node that services a large area. There should be as few WIDE nodes as possible (preferably only one) covering a given area; otherwise the resulting redundant packets oversaturate the network, increasing collisions and delaying traffic. Too many big egos make for too many WIDE nodes in too small an area, to the detriment of all...

RELAY describes a lower-powered (and lower-antenna'd) station covering a limited area which may not be covered by a WIDE node. Its job is to pick up packets addressed to RELAY,WIDE... and relay them to a WIDE node. This allows "fringe area" or very-low-powered stations that can't hit a WIDE directly but can hear one (or can hit it but have trouble being heard consistently over all the other stations) to participate in the network.

Corrections welcome...

Just depends on how far you want your position reported... your current
settings will get you two hops. Around here a common setting is
RELAY,WIDE3-3, which gets up to four repeats.

Depends on your area and what you're trying to do.

The first RELAY is good - hopefully gets your relatively low-powered signal to a digi that can relay it.

The WIDE then distributes your packet around the region.

The question is: how far does that first WIDE go? Does it go far enough to get your packet where you want it to? (Like to an IGate so it can get to the Internet and hence to www.findu.com ? Or back to your house so your significant other can see where you're at?) How far WIDE covers depends on the APRS environment in your area.

You might consider going to WIDE2-2 or WIDE3-3, but what's appropriate depends.

For grins, take a look at: http://www.findu.com/cgi-bin/find.cgi?VA3BJD

132. WinAPRS - AGW Question

Yahoo group: APRS (1998 — 2006)
Date: 2001-10-14 00:48:33 UTC
From: jason@atrs.com
Topic: 132 Message: 132

Hello,
I am using WinAPRS 2.4.6 and am using AGW to interface to my tnc.
I am having trouble setting my PATH in WinAPRS. It seems that there is a character limit in the text config file for WinAPRS. I am setting my path in the AGW_Local.prt file under the WinAPRS/Ports folder.

When I enter a path it will cut off the last few characters if it is too long, for example the path I have set is:
W4QDC-3,WIDE,WIDE
and only transmits W4QDC-3,WIDE,WI
When any packets are transmitted it will cut off the last 2 letters.
It seems that WinAPRS will only allow 15 characters in the PATH when using AGW.

Does anyone know what my problem may be here, or if it is a bug with WinAPRS.

Any help would be appreciated.

Well I'm not really using a TNC, I am using my soundcard with AGW to act as a TNC. I would think that AGW should allow more characters than this, I am using the latest version of AGW also.

Any thoughs? Is it something in WinAPRS or is it something wrong in AGW.

Thanks
Jason

137. APRS with KPC-3 & Tripmate

Yahoo group: APRS (1998 — 2006)
Date: 2001-10-24 21:53:26 UTC
From: Daniel
Topic: 137 Message: 137

Hi everyone,
I just bought a Delorme Tripmate GPS and a Kantronics KPC-3 (the old one, not the KPC-3+ !) with firmware load 6.0. I have been told there is a release 8.2 for this TNC. Could anyone tell me where I could get it pse?

I made the hardware modifications on the Tripmate (6-volt regulator, loopback of TX & RX, Enable to VCC), and connected it on the KPC-3. It works but I have a little strange problem: when I apply power on them, the TCS starts sending NMEA strings continuously, and stops after 20 seconds. After, nothing else is sent. if I apply power on the GPS, wait 30 seconds and then power up the TNC, it sends NMEA strings normally, as configured with BLT. My config is:

```
GPSHEAD 1 $GPRMC
GPSHEAD 2 $GPGLL
GPSHEAD 3 $GPGGA
GPSHEAD 4 $GPVTG

LTP 1 APRS VIA RELAY,TRACE,ECHO,WIDE,WIDE
LTP 2 APRS VIA RELAY,TRACE,ECHO,WIDE,WIDE
LTP 3 APRS VIA RELAY,TRACE,ECHO,WIDE,WIDE
LTP 4 APRS VIA RELAY,TRACE,ECHO,WIDE,WIDE

BLT 1 EVERY 00:02:00 STARTING AT 00:00:00
BLT 2 EVERY 00:02:00 STARTING AT 00:00:30
BLT 3 EVERY 00:02:00 STARTING AT 00:01:00
BLT 4 EVERY 00:02:00 STARTING AT 00:01:30
```

Do you have any idea of the problem? Any help will be appreciated.
Many thanks.

Daniel VE2BAP, Montreal, Canada

From: Daniel
Topic: 137 Message: 140

I just consulted Kantronics web site; they sell the load 8.2 eprom
for KPC-3... 60 $ US! DOH!

A bit expensive... Anyone has a used one to sell ? I will first look
for this alternative before ordering one from Kantronics.

Do you think this release could solve my nmea strings problem?

Thanks for the info.

For $60 bucks you can get an old 486 and run the early version (I got 8.0)
TNC AND look up the calls received from a CD rom callsign data base!!!

From: Philip J. Kubat, Jr.
Topic: 143 Message: 143

Hello,

I just downloaded WinAPRS and its not mapping any stations (but mine). I do see some "flash across" the bottom on the screen?? What do I need to set for WinAPRS to "see" and thus map stations? APRS+ has a similar problem, I see the station in the TNC window, but not listed. I have not registered either s/w yet, do they not work until they are registered?

BTW: My station (IC-746, KAM98, PC) works fine with VHF packet using pacterm.

What software that most station use? Or what is the best? (So far I have looked at WinAPRS, APRS+ and UI)

Thanks!
Phil - KB1DZF

144. setting up behind a router

Yahoo group: APRS (1998 — 2006)
Date: 2001-11-18 10:59:22 UTC
From: Randy
Topic: 144 Message: 144

Anyone has information about setting up APRS-SA behind a router? We have one set up right now and cannot seem to get the position data passed from the TNC to the net. I suspect we need specify a setting on the router what port(s) need to be open for the APRS to work. And yes we have the box checked off to pass the traffic to the net :)
Any info. is appreciated.

Hi Klaus,

I just went through what you are trying to do within the past couple weeks. Sometimes documentation is hard to find on how to go about doing things.

I am using APRS-SA. You can download it from the net. You will need to register it in order for it to pass the reporting from the tnc to the net. Its pretty stright forward to set up. Download it from http://www.tapr.org/~kh2z/aprsplus/

Yes, I am using it right now, first you must download a program
called AGW Packet Engine available at: http://www.raag.org/sv2agw/
and then when you are running WINAPRS go to settings-ports list and
choose:
AGWPE on LOCAL
You must first run AGWPE BEFORE starting WINAPRS.
don't forget under settings to fill your station information.

Good luck de Gil VE6GES

153. Want cheap, quick setup for car. Recommendations?

Just joined the group and have a newbie question. I would like to set up APRS in my car. My intentions are to put the GPS, TNC and rig all in the trunk. I don't care about being able to view the GPS unit. I have an Alinco 2m HT and separate gel-cell to power everything. I know I'll need to get a GPS and 2m external antenna. Any suggestions for a cheap TNC and GPS device that work together would be great. I don't want to pay alot, but I'd like to set it and forget it.

I have a complete APRS transmitting station in my vehicle. I bought a TinyTrak unit at Dayton last May, and I'm completely thrilled with it's performance. I was able to build the unit in one afternoon, and then with some additional hardware, I mounted it under the dash, and had all the control switches and led's in a panel in a spare hole on my dash. I bought a Garmin GPS-35 sensor unit on Ebay for less than $100. It has the same size and appearance of a computer mouse. It's basically a just receiver that outputs NMEA data every second. It's mounted on the far corner of my dash near the windshield. Most of my passengers don't even notice it till I point it out.

The transmitting portion of the system is an old Kenwood TR-7400 mounted under the back cargo cover in my Subaru station wagon. All the devices are powered by the switches on my dashboard control panel, and there's one main on-off switch. So when I hop in the car and want to start APRSing, I just flip the one main switch, and all three components (TinyTrak, GPS, and tranceiver) turn on and start operating. Then whenever I want to stop, just one quick flip again. It's very simple and easy to operate. I'm working on a web page to describe the entire setup, complete with pictures. I'll post it on here when I get it finished.

Steve Dimse has provide a great service to amateur radio: APRS Database Access.

The purpose behind this system was to link all the various local RF networks into a single real-time wide area network. This system stores a single position and weather report for each station. To see stations quickly like KC7VWW, copy and paste this string into your browser: http://www.findu.com/cgi-bin/find.cgi?kc7vww&radar=*** and you can sub your callsign or others for KC7VWW.

Lots of options on this site, find nearby station, live radar view, qrz lookup, messages, etc . . . Have fun!!

Hi. Do they work the same way as the TripMate/Earthmate, with Street Atlas software? Does it put out NMEA?

I have a TripMate that appears to work, but lately it puts out gibberish as far as Street Atlas is concerned. It says "No GPS" then quickly flips to "No Fix" and never, ever gets its location. I checked it on 2 laptops, I checked the GPS type, I checked the system clock, I checked the raw data tab. Nothing seems wrong.

And to bring it on to topic, can you tell me in very basic terms what I am looking at if I want to build a vehicle tracking device that via packet hops will show the vehicle's position, specifically on a Street Atlas display? There is an article in the current QST but it seems to be specific to the Tiny Track and "Streets on Disk" software whatever that is. I already have the licensed Street Atlas 7 (and 6 and 5 and 4 and 3... how much have I spent on upgrading, and I don't even like it that much! But I am used to it, and didn't like MS Streets because it was different enough to SA that I stumbled too much)

Please fill in the blanks on x, y and z below as to what I need:

Larsen active magnetic antenna-->Your GPS board-->x?x--y?y-->2m TXcvr-->z?z-->PC with Street Atlas for display and tracking. It would be nice if it would either broadcast the vehicle if it is running or even better if it could be polled occasionally as an option.

I imagine there is stuff needed between the board and a radio, and a packet TNC on the receive end, and how many bucks?

I have an old MFJ-1224 (?) packet modem with 2400 baud option. Is that gonna do anything for me?

I am asking because I have been licensed since 1977 but managed to avoid the whole packet thing. I guess it, and the Internet, caught on, so maybe I should try packet/APRS. So, a primer please!

Thanks

159. Help Needed

Yahoo group: APRS (1998 — 2006)
Date: 2002-01-23 18:08:57 UTC
From: ve3nxt
Topic: 159 Message: 159

I am new to the APRS thing. I have a KPC-3+ and running Win APRS software. I do not see any stations. I see myself. I can see digi's if I select to overlay them.

But I see nothing else. Only traffic scrolling by the bottom of the screen.

I have tried numerous websites but there does not seem to be a basic set up for me to see the other stations. What am I missing?

When I run PacTerm on a PAcket freq. I see lots it just this APRS thing on 144.390 that I cannot get up and running.

Any help or info would be great.

160. LiveAPRS from Denmark

Yahoo group: APRS (1998 — 2006)
Date: 2002-01-28 10:58:37 UTC
From: Finn Stampe Mikkelsen
Topic: 160 Message: 160

Dr Om's

Due to yet another server breakdown, the LiveAPRS coverage of denmark has been unavailable this weekend. As a result of this 1000000'th breakdown, a new arrangement is being negotiated, which should bring a new host of www.aprs.dk within the very near future.

In the meantime, i hope you will forgive any instabillity of www.aprs.dk and return for another look, if the page should prove unavailable.

But... Have a look at www.aprs.dk and click on the QSX frequency reference in the top, and have a view of live APRS coverage in Denmark. The reciever is located in Odense in the very heart of Denmark.

In the near future, a fullblown server and total coverage on the danish aprs.net is planned, so watch out for this page...

There is a menu where it says something like "Open VHF port" This could be the problem.

I am a newbie and am setting up Winaprs tonight, I am just playing around with the TCP/IP connections and will wire up ye olde PK232 tomorrow. In the instructions it says I can view some cation via a TCP/IP connection if I have the APRSserv.txt file, I don't have this. Where do I obtain it?

If there is anyone who can elmer me on the Internet use of APRS I would appreciate it.

164. Help setting up a KPC-3Plus

Yahoo group: APRS (1998 — 2006)
Date: 2002-02-06 06:02:09 UTC
From: mountainops
Topic: 164 Message: 164

Hi all-
I am tring to set up a mobile aprs station with no computer on it.
I have a FT-1500 wired to my KPC-3 Plus and a GPS III Plus.
I have the wiring set up correctly. But I try to set up aprs on my computer via a terminal program, and then I change the user intface to gps on the kpc 3. then unplug the computer and plug in the gps.
It seem to be storing the gps info because I look back later in the buffers and the GPS seems to be posting to the tnc.

The set up will beacon but never seems to hit the aprs network.

Is there a web page any place that shows exactly that I need to set up in the tnc on the kpc 3?
I need it spelled out for me...Duh.... Argg.
Thank You
Rich NF7D

166. Newbie questions...

Yahoo group: APRS (1998 — 2006)
Date: 2002-02-06 07:22:00 UTC
From: wa6ilq@qsl.net
Topic: 164 Message: 166

A few newbie questions...

1) what's the minimum computer needed to run WinAPRS ???
I've got an old 486-66 that I can dedicate to the task...
It has 32meg, a 1gig drive and Win95B running on it now...

2) I've got a KPC (no suffix number, so it has to be an early
model) with very very early firmware that I was going to use
with the above computer. Will I need to upgrade it, what's the
latest version available for it, and where do I get it?

3) My other TNC is a MFJ-1274 TNC-2 and the wall-wart
power pack is missing. The box just says "12vdc".
Does anybody have the current rating, and is it tip-positive
or tip-negative?

4) a friend who is even less APRS knowledgeable than I am
(if that is possible) saw a demo of APRS and is jumping in
with both feet - he has an old Toshiba Pentium 150 laptop
that has only one serial port and no USB port... I have an
old Thinkpad 486-66 that has a similar port configuration.

He wants to set it up for mobile APRS with his GPS unit
and a TNC (probably a KPC-3) - i.e. able to watch folks
driving around ...

Plus somewhere he heard that there is a program that
will plot Doppler-derived fox-hunt bearings on a laptop map, and
that it integrates with WinAPRS... and the Doppler Systems
Inc. DDF-4000 series has a serial port that will deliver bearing
info on the fly...

So he's decided that he's going to have to add a serial port or
two...

I see two options:
1) a PCMCIA card that has a serial port. The Toshiba
can swallow two of these cards.
2) a PCMCIA card that adds a USB port plus a USB to
serial converter. Or two.

Option 2 will allow him to immediately hook up both the GPS
and the TNC, and later add a $10 USB 4-port hub and add
another serial port or two should he desire to connect a
serial port from a Doppler unit or maybe a BC-780 scanner
that has a serial port or who knows what...

Anyway, does anybody have experience (positive or negative) with hooking GPS units, TNCs, etc to USB-connected serial ports ???

And does anybody know about this transmitter hunting software? Supposedly it allows multiple fox hunters to coordinate on a hunt... everybody's bearings are sent via packet and appear on the fly on everybody's screens....

167. unproto path - trace?

Yahoo group: APRS (1998 — 2006)
Date: 2002-02-06 10:23:36 UTC
From: bunboy
Topic: 167 Message: 167

Hi
I am new to APRS and I'm trying to figure some stuff out. I really appreciate any help you can give!

I was hoping somebody could help me figure out the ideal unproto path. I've been reading LOTS of stuff, but it's hard to tell what's current, and what it all means.

I THINK the best, simplest path is "RELAY,WIDE" I guess if you want to hit an IGATE and there aren't any nearby then "RELAY,WIDE,WIDE" would help. Is that the same as "RELAY,WIDE2-2"? With WIDE2-2 can the digi's subsitute their call, or is that a reason to use "wide,wide" instead?

Now what about trace? Since it increases packet length I should only use it when I am trying to send a message to somebody so they know the specific path to respond to me? And then once they know the specific path to me I don't need to use it anymore?

What is the right way to use trace? I think "RELAY,TRACE2-2" would be good, but then I realized that some digi's might not support trace. Is that true? If so, would "RELAY,WIDE,TRACE" be a better option?

I know these are a lot of specific questions, but i'd appreciate any help anyone can offer - you can send me email directly too at berson@...

Thanks!
-Adam

How much is an Earthmate with an unknown problem worth to you? Street Atlas recognizes it (it gets past "No GPS" and waits at "No fix" forever)... there is data coming out, just unusable.

Perhaps you can fix it and do something with it.

Then again, I would like very much to get into APRS but know almost nothing about it.

What "units" are you building into Tripmates? How simple can life be... can you take an Earthmate and put a gizmo into it and feed it into the packet audio input of a radio or transmitter? THAT would be really sweet.

I would like to try APRS but am not relishing the thought of cramming a GPS+TNC+2m transmitter or transceiver into a vehicle. If I could get an MFJ Data Radio or take an old junker 2m radio and feed a GPS into it directly I would be very interested.

Then, how do you track on the other end? Need a TNC and some interface to Street Atlas?

Thanks

I have attached a quick APRS info sheet for you. I believe that there is a few Earthmate units being used and the group will be able to give you sites with the modifications.

I can find a good home for the Earthmate if you need to find a good home for it.

Well, I am having goofy problems. I think the Earthmate is not being read by
the computer at all, yet I have developed suspiciously similar difficulties
with my Garmin GPS2 Plus... I wonder if there is something wrong in the car
that's blocking signals...?

Anyway, I'll post a forsale if I determine I can't use it anymore.

From: kc2hsu
Topic: 182 Message: 182

Hello Everyone!

I was just wondering if I could get some opinions about the D7A(G) portable. I am trying to decide if I want that radio or an F6A. Because of the spots of local digipeters, I will have to set my house up as a relay, but it seems that this is really going to cost some $$$. Plus cords for the GPS Unit. I am very interested in APRS, and have it at my house and is on almost all the time. Maybe I should just stick with the house setup. P.S. I am 14 years old so I can not drive but I could use it when I am with my dad, and use his mobile 2m antenna. Thanks everyone!

Subject: [aprssig] findu.com backup server project

From: Guy.Story@..., KC5GOI <kc5goi@...>
Reply-To: gstory@...
Organization: Itel-Tigerbyte
To: "TAPR APRS Special Interest Group" <aprssig@...>

Good morning everyone. This is a reminder that contributions are being
being solicited for the backup findu.com server. Below are the
agreements by clubs and volunteers. This project has the backing of
Steve Dimse, K4HG and he has made the first donation. Steve will not
own this server, it will not be at his residence or be under his direct
care.
Steve has volunteered to help with the initial installation and initial
technical support.

????????Clint Miller, KD5BYY and co-owner of Itel-Tigerbyte
(http://www.tigerbyte.com), has agreed to provide the installation and
maintenance for the server. After Steve helps with the initial setup,
the server will be his responsability.

????????TAPR has offered to be a gateway for your donations. ?Any
credit card donations can be handled by TAPR, just be sure to indicate
they are for the "findu.com backup server". Donations maybe be
mailed to

TAPR
P. O. Box 852754
Richardson, TX 75085-2754

or

Tucson Amateur Packet Radio
8987-309 E. Tanque Verde Rd., #337
Tucson, AZ 85749-9399

The Texas address is the quickest since it is the physical location
of the TAPR office.

? ? ? ? The Denton County Amateur Radio Club has offered to be the
caretaker
organization and will issue a 501c3 letter to any user who can make a
tax deductible donation. ?The Denton County Amateur Radio Club may be
found on the web at http://www.lsic.net/dcara/dcara.html. ?For
individuals to make tax donations, someone has to assume ownership of
the server. Donations may also be sent to the DCARC at
```

DENTON COUNTY AMATEUR RADIO ASSOCIATION
PO BOX 50433
DENTON, TX 76206

????????In case this project does not achieve the required amount to purchase the server, donations of $50 or more will be returned (less credit card processing charges, if any) with smaller amounts remaining in the TAPR Foundation.

Here are some specific points that need to be addressed:

* The server will be in service for the Amateur Radio Community. ?It's sole use is for the findu.com backup.

* Itel-Tigetbyte will be getting a T1 line and has donated the connectivity that the T1 provides.

TAPR related:

* TAPR will forward the money to the purchasing organization.

* Tax deductibility depends on the status of the purchaser, not TAPR.

* TAPR will not own, administer or maintain the system and will have nothing to do with the server beyond turning over the donations to the purchaser.

* Any excess donations will be turned over to the purchasing organization with the understanding that these monies will used for a maintenance fund and not for monthly electric or bandwidth bills.

Checks and money orders are the preferred method of payment for those wishing to make a tax deductable donation. Checks or money orders need to be addressed to either TAPR or DCARC with a comment in the notes column Findu.com backup server.

If you are wanting to make a donation and receive a letter letting you write
it off you
your taxes, you will need to make the check to the DCARC and in the notes
column it is critical that you indicate it is for the findu.com backup server. ?Make sure that you indicate that it is for the findu.com backup server. ?Donations from clubs as well as individuals are welcome. ?I
am not a member on many APRS and weather related mailing lists. ?Please pass
this on to those lists.

Thank you for your help and donations.

184. ONSTAR GPS Feed

Yahoo group: APRS (1998 — 2006)
Date: 2002-03-10 01:35:32 UTC
From: kc7hex
Topic: 184 Message: 184

I was wondering if anyone has tapped off the ONSTAR GPS output for the TM-D700 radio. It would be great and will save using another GPS since the vehicle has one already.

Any inputs would be greatly appreciated.

From: ml41782
Topic: 185 Message: 185

The Downtown Fredericksburg, Va. Digi (K4MQF-1) is in place and fully operational. A minor glitch in the GPS coordinates will be corrected this week.
The Other Digi is (K4MQF-2) is in place in Spotsylvania County. It will be raised up the existing tower to 200ft as soon as the weather and crew can coordinate. It is currently working at 110 feet.

Testing so far is showing incrediable outlooks for this area. An IGATE is in the works as well. More information on that very soon.

Please don't do it again.

Why not?

Why would a message describing an item for sale on eBay be unwelcome where a
message describing the same item for sale otherwise is not?

I am assuming that in general postings to aprs@yahoogroups.com about
personal APRS-related items for sale are permitted. If so, I for one (yes,
I know I'm not the moderator) see no problem with eBay being the method of
sale, and would like to know the reasons that you do. If not, then you
should probably put a note in the Yahoo group description saying that
for-sale posts of any kind are forbidden. I checked, and didn't see
anything there regarding for-sale postings, eBay or otherwise:

Description Category: Radio
APRS is Automatic Position Reporting System originally developed by Bob
Bruninga. It's a communication network used by Amateur Radio Operators to
show, on a map, the locations of our stations. This is a back up list
to the APRS list at tapr.org. Feel free to join this one, but I don't
intend for it to compete or replace the other one. Lately the TAPR list
has been going down for hours at a time, so maybe we can use this is a back
up. Ray, KD4BBM

190. Fredericksburg / Spotsylvania Va.

Yahoo group: APRS (1998 — 2006)
Date: 2002-03-29 11:45:58 UTC
From: ml41782
Topic: 190 Message: 190

OK ! All of the work is done and it all looks good so far. The 2 digi's Fredericksburg(k4mqf-1 /110 feet/45 watts) and Spotsylvania (k4mqf-2 /210 feet /45 watts) are up to height and fully functional. They both appear to be an asset to the system in our area. I have a few minor items to tweek on both TNC's this weekend. We are now receiving station from NC and Maryland into this area.

We expect the IGATE (k4hwk-9) to be operational shortly. A backup box has been built as well (k4mqf-9). Both boxes are running Redhat Linux 7.2 , APRSD2a15 and XASTIR-1.1.0 . I the event k4hwk-9 goes down k4mqf-9 will be brought on-line. (I Like fail over redundancy) We will be building an on-line testing method to keep the one box idle unless the test showes it down. At that point k4mqf-9 will become active and start igating traffic. Any thoughts ? Ping is definately out. I am looking for a string to search for to tell me that the box is no longer available.

These boxes will allow local traffic to be gated to the internet and only a handful of call signs to be gated from the internet to RF in the Fredericksburg / Spotsylvania Area. If you pass through this area on a regular basis please email myself and we can arrange to have your traffic gated out to this area. We home this will be made operational by early next week.

191. Stupid Question

Topic: 191 Message: 191

I am brand new to APRS/ Packet, and I was wondering if someone could explain how a GPS Rcvr (Delorme Earthmate w/ NMEA sentence translator) connects? to TNC or computer? since that model uses the parallel port I thought the TNC would need-
I am not sure what TNC I will run yet, but it won't anything fancy.
I am planning on using APRS+SA, w/ Street Atlas 8, and Kenwood TM 261a (Or, WinAPRS)
Anything else, other then connecting the radio into the TNC that I should know about?
Talk about being lost.. :)

From: Simpson, Jr, Joe B.
Topic: 192 Message: 192

Yahoo has apparently made a sneaky change to everybody's "Marketing Preferences," changing all their "No's" to "Yes," the result of which may be a load of spam. To change it back:

Go to Yahoo Groups (http://groups.yahoo.com) and sign in. Click on 'Account Info' (upper right-hand corner), verify your password, and your Yahoo ID card comes up. Click on 'Edit your Marketing Preferences' (about halfway down the page in the left column) and change all those Yes's back to No's. Click 'Save Changes.'

From: ku4zd
Topic: 193 Message: 193

Good morning all. I am trying to get started with APRS. I want to start out with my soundcard and have the AGW Engine, AGW monitor and WinARPS.

I have the AGW Engine set up and running. I can see traffic with the AGW Monitor but am not getting anything in the WinARPS map.

I setup with what I thought I read in the docks (after starting the AGW Engine click on settings then ports (in WinARPS) and select the AGW soundcard setting.

Anyone offer any help in getting started here?

Date: 2002-04-02 05:06:49 UTC
From: ke4nyv
Topic: 194 Message: 195

I could be wrong, but I think the Jornadas don't use a "true" RS-232 interface, I think it's somewhat TTL. I kind of ran into that with my older Sharp Wizard (see my site at http://www.ke4nyv.com under the Portable Packet). If this is the problem, you might be able to fix it using a MAX-203 IC from http://www.maxim-ic.com.

Good luck and 73's

I have a Jornada 680 with full keyboard, but I believe they are built around the same architecture. I have used a CF GPS, and a GPS connected via serial cable (where the sync cable plugs in). The only problem I ran into is the fact that the sync cable would not work. I had to purchase the "serial adapter" cable. Hope this helps!

197. probs with APRS software & Win2k or WinXP

Yahoo group: APRS (1998 — 2006)
Date: 2002-04-10 02:53:48 UTC
From: robohaxx
Topic: 197 Message: 197

hey all,

I'm running a KPC3+ which I have configured as a RELAY near the Alexandria VA area. It works fine, the little KPC3+ is simple to program and works great.

The PacTerm for Windows program works fine within Win2k and WinXP. Any other program I try, such as UI-View, WinAPRS, APRS-SA, APRS NetSpy, etc., are never able to capture any posit information from the many packets I get. When I flip over to the TNC window in APRS-SA or NetSPy, I can see packets coming in. Apparently, these packets can't be parsed by the software because I never see any indication elsewhere in the program(s).

I do see a difference in the packets, as translated by these programs. The packets have from 1-3 special characters appended to the beginning of each line. In PacTerm, I don't see these characters.

Is there a setup value I've missed somewhere that is causing the packets to be malformed?

Any help would be appreciated.

Thanks,

DanR

Topic: 197 Message: 198

I use a KPC3+ V8.3 with UI-View on Win2K everyday. Just a shot in the dark but you might want to check the KPC3+'s current settings to see if PacTerm has changed anything. If you don't see anything you might want to go ahead and reset everything to the factory defaults and set up the TNC as recommended by one of the programs you are trying to use, then make sure the program is working. Copy the current configuration to a flat file and start PacTerm. Exit PacTerm and copy the new configuration to a different file and compare it against the first file, this should tell you what has (if anything) changed.

Good luck,
Bernie, K3BAZ

Thanks for the tips, Bernie. I reset my KPC3+ using 'RESTORE D' and basically started over. I still can't get anything other than PacTerm98 for Windows to communicate with the TNC.

I posted a message on the Kantronics 'elmer' board, and we'll see if I get any responses.

I've heard some scary stories about Kantronics tech support. I just hope this is a 'user' error, and not a real hardware problem.

For what it's worth, Bernie. Maybe you could do a 'DISPLAY' on your TNC and post your settings here. Then I could compare what I have to what you have and see what's different.

Also, I'm not real smart yet on the different terminal modes, so maybe it's something as simple as that. PacTerm seems to use the TNC in HOST mode. Are other programs able to use that mode? Should it be set to something else before I exit PacTerm?

If anyone else has an idea, please chime in. I'm really at a loss here.

Thanks,

DanR

Hey All,

Let me be the first to say that the Kantronics 'elmer' board had a posting less than 24 hours after I posted this problem.

even though that post helped, i found the answer where i should have looked in the first place... the Kantronics FAQ. i was always in HOST mode, which PacTerm liked, but nothing else did. To get to TERMINAL mode, i had to send a ctl-192, Q, then another ctl-192, then enter. who came up with that combination?

anyway, things are working...

Cheers,

DanR

Is this in conjunction with WinAPRS?

The impression I'm getting from the official APRS mailing list at tapr.org is that WinAPRS is basically dead. The authors haven't been heard from in a long time and the last few releases are buggy. It doesn't surprise me that the old versions are not compatible with current OS's.

Hello all,

I am completely new to APRS and plan to install a dual band radio with APRS on my Honda GL1800 Gold Wing. I wonder if anyone on the list has done this or something similar. Any ideas on antennas, equipment, installation, etc, would be appreciated.

Has anyone heard of any new APRS capable radios coming out in the near future? It looks like the TMD700A or the Kenwood HT are the only game in town.

Do any of you also use radios without built-in APRS, and if so, what advantages/disadvantages are there? What equipment does one need, and what recommendations do you have? Many thanks.

205. DX Packet clusters

Yahoo group: APRS (1998 — 2006)
Date: 2002-05-03 19:21:34 UTC
From: ml41782
Topic: 205 Message: 205

Isn't it bad enough that it is getting harder and harder to find a clear pcket Frequency of 2 meters that now some of them have resorted to send DX packet information over APRS.
These types of messages should be banned from APRS and should be limited in the number of packet Frequencies they can use on any band. If some one wants the information they should go to that Frequency and and get it.
I am sorry for blasting out. I have a sore spot for DX packet information when you are trying to setup a network and the next thing you hear is DX packet cluster $%^#%. What makes it worse is the fact that I am now seeing it on APRS messaging on 144.390. I have started recording all traffic to capture it and tell some one how I feel when I find out who is doing it.

well that was my 2 cents on the subject.

Mike

Why do you receive SPAM on a Yahoo!group?

Easy. The list is set so that anyone can join. "Robots" join lists and then post to them.

The owner can set the list to "moderated entry"... and a file is generated to be sent to pending members...and everyone who tries to join is sent an email requesting a valid callsign or a statement on their interest.

Often, the user ID *IS* a callsign so the choice to allow entry is obvious. The owner and moderator get an email from Yahoo! asking if the person can join. Click "reply" and they're in. Otherwise the owner/moderator waits for the email from the member giving the credentials, and goes to the "pending member" page to allow entry.

Robots do not read the mail so they don't "get" what to do. The owner cleans out any pending members over a period of time who haven't responded.

Well... That's the way that SOME mod/owners try to
weed out the chaff :) Thanks for mentioning in Pres.
"I AM NOT A ROBOT" <grin>

Say... Do you think Bob B. would have any kind of
discount set up for APRS registration, if SATERN
eventually gets to the point of having mobile
computers in the canteens and wanted to install
APRS in each vehicle so they could be mapped
during an emergency or disaster response ?

Maybe even some donated registrations ? ;)

Still need to find some inexpensive (small>
GPS/TNC/XMTR units, maybe with a PIC that
sends the data after the PTT is released.

210. Stand Alone Digipeater

Yahoo group: APRS (1998 — 2006)
Date: 2002-05-12 12:43:39 UTC
From: crgagner
Topic: 210 Message: 210

I have a 2m mobile and a Kantronics Packet Communicator 3 (an older version) that I would like to set up as a stand alone digipeater. Could someone send me the settings needed for this to work ? The only stuff I have found is for v8.2 firmware but this is an older version. It acts like it receives and if I hook a terminal up to it it seems to be receiving the info but it doesnt transmit ???

Thanks

Craig
W1MED

211. RE: [APRS] Stand Alone Digipeater

From: Jesse
Topic: 210 Message: 211

The reason being is that 8.2 has the UI commands to allow digipeating of APRS.
I can send you the UI commands.. but they won't do anygood since your KPC doesn't have them. Or does it?

I can't remember when the UI commands started but I know they are in the 8.2.

From: Craig Gagner
Topic: 210 Message: 212

Is there anyway to flash the older unit ?

If not I guess I will have to put together an old computer to put at the tower site.

Thanks

Craig

From: Jim Andrews
Topic: 210 Message: 214

No, it's conventional EPROM based.

You have to get the upgrade from Kantronics ($59 I think).

You can pick up an old laptop off E-Bay for very little. I had one set up on a site here locally for about a year before going to a KPC-3+ and it worked great. The TNC was an old kam.

Your firmware must be REALY old to not handle <UI> frames. My KPC-3
is about 7 years old and I have set mine up as a stand alone digi and
it works great.

Don't waste time putting a computer out there. You'll have more problems than you wish for!

You can buy the upgrade for something like $40 from kantronics. Save yourself a HUGE headache in the long run.
I run 3 KPC 3s that I had to upgrade to the + but I bought my chips used from another ham. I tried the digi through the computer and it didn't work so well. It was great for about 7 days and it then became more problems than I care to mention. And this was at my house.. Imagine driving 40 miles one way to fix a digi.

220. RE: [APRS] Re: Stand Alone Digipeater

Yahoo group: APRS (1998 — 2006)
Date: 2002-05-13 03:04:21 UTC
From: Jesse
Topic: 210 Message: 220

Jason,

That doesn't really digi the UI commands. If someone were to put you in the path then it would work. What Craig is wanting to do is put a real digi up that will digi the UI also. KPC 3+ will do this. There is a UI command set there.

Craig,

http://www.kc5goi.net/aprs/digipeater.html

Check out Guys web page. I have the link above. It will explain all the settings and such. These are the same setting I use in mine.

Word of warning.. make sure you have a good rig and run about 1/2 the power it is rated at.

My 50 watt rig was glowing red when I put up my digi for a bike race. I cut the power back to half and fans (which in the long run wasn't needed at half the power).

For a digi you only really need to be able to hear.. xmit is not something you need to get out unless you are the only digi in the area. Let the GATES and such do most of your work. Since most of the time they are located at someones house. You just need enough power to hit those. My digi runs 5 watts right now since I have 2 gates down the road from me and I can hear them fine. I just run local coverage for the whole in my area. But I am also up 40' which gets me 20 miles to my closest gate.

From: John Townsley
Topic: 222 Message: 222

I am operating with an aea pk12. Although I receive local packets, they do not display on my map. Only stations incoming through an igate display. If I log onto an aprs server they all display. Does anyone have an Idea which parameter I have eliminated the locals with. I have done a hard reset and spent a few hours trying to figure this out.

==>PRECISION EMERGENCY AUTOMATED POSITION REPORTING SYSTEM TEST SET

The Air Force Research Lab, Rome (New York) Research Site, will conduct an experiment using Amateur Radio operators as an auxiliary line of defense against aircraft disasters. The Precision Emergency Automated Position Reporting System (PEAPRS) test will be carried out in conjunction with the annual Team Patriot exercise. The ARRL is co-sponsoring the test.

The test will consist of two aircraft flights sometime between June 3 and June 8. During these flights the aircraft will transmit a distress message, using the call sign WA2ZXS. Amateurs wishing to participate in this exercise should, upon receipt of the distress message, send an e-mail message to peaprs@... detailing the time, characteristics of the message received and the method they used for reception (direct, via digipeater, via wide relay, Web, etc).

Those lacking e-mail capability may participate by calling their observation info into the PEAPRS Command Center at 315-330-7444.

The objective of this exercise will be to measure the timeliness and accuracy of the reports received from the amateur community. Amateurs that participate in this program will qualify for a special certificate from ARRL recognizing their participation.

225. Kenwood 700 & WinAPRS Connect Prob

Yahoo group: APRS (1998 — 2006)
Date: 2002-05-31 04:04:47 UTC
From: ve3npg
Topic: 225 Message: 225

I am using an IBM Laptop with a rs232 on port 1 and I do not seem to be able to get the APRS info received by my Kenwood 700 moble to be transfered to an appropriate map. I don't think it is my cable as the Kenwood programming software works on the same laptop/cable and radio. I have seen it work at VE3JW with the same model of radio and same software (WinAPRS). Must be a setting I have missed. Help.

226. ID Requirements under CEPT with Kenwood D7-A(G)

Yahoo group: APRS (1998 — 2006)
Date: 2002-06-03 06:36:47 UTC
From: schreck
Topic: 226 Message: 226

I'm getting ready to travel to France and would like to work APRS while I am there. As I understand it, the CEPT agreement requires me to identify with a preceeding "F/" and a trailing "/P" or "/M."

The callsign in my radio is restricted to a maximum of nine characters, which are further restricted to letters, numbers, and up to one hyphen.

Does anyone know of a legal way to use the D7 overseas without a laptop and additional software that would enable me to use the callsign field to correctly identify myself? Is it okay to correctly identify myself in the Status text, for instance?

Any help would be greatly appreciated.

Schreck

From: Lee Inman
Topic: 226 Message: 227

Schreck,

I believe the requirement for identification can be met by including the necessary callsign and identifiers as part of your comment string. The callsign field itself will not accommodate the necessary special characters or length.

Have fun on your trip.

Small world!

From: cardealers
Topic: 230 Message: 230

I am sending this to the lists I am on regarding Ham Radio. I guess in a way it is S P A M about S P A M. Anyway, I am sick and tired of the constant "Wow, I just found this terrific site" crap, and especially disgusted that it is coming from spoofed identities. I would bet that the Amateur Radio callsigns/email addresses/identities of the different people sending this crap are not actually the people they would seem to be, but rather innocent people. Anyway. I did a lookup of ab7sl.com and found it to be hosted via www.domaindiscover.com and their phone numbers are: toll-free at (877) 518-4965 (International customers: call us at +1 (858) 560-9437) or email at support@... so everyone who wants to put a stop to this please call and complain. Tell them that ab7sl.com is sending S P A M. Do it tomorrow.

Hi Robert,
I use the Alinco DR-135TP with the built in TNC for APRS.It works great with APRS as long as you leave your computer on all the time. I have not gotten around to figuring out how to use it wihtout the computer on all the time. Or for that matter if it is possible to use the radio on APRS without the computer running the APRS program. I use WinAPRS on my computer. This radio/TNC combination MAY NOT be suitable for a regular type of packet operation as far as a mailbox is concerned. There does not seem to be a mailbox in the built in TNC that I am aware of. If anyone should have different or more information on this rig, I would be interested.

Topic: 229 Message: 233

I recently got a DR-135TP and am still playing with it but it's a great rig. Right now I am using it with my Palm Pilot and PocketAPRS (www.pocketaprs.com).

You can also use the unit for tracking without having a computer hooked up at all (requires a GPS unit obviously). To do that, use the following setup:

```
FLOW OFF
GBAUD 4800
GPSTEXT $GPRMC
LOCATION EVERY 6
LPATH GPSMV VIA RELAY,WIDE
LTMHEAD OFF
MYCALL CALLSIGN-X
LTMON 10
UNPROTO APRS VIA RELAY,WIDE
AUTOLF OFF
ECHO OFF
```

What this does is transmit your position every 60 seconds (6 = 60 seconds). Insert your callsign under MYCALL, plus the SSID you want (i.e. - 9 for car, etc.).

The nice thing about this unit is that you can program channels to be data only channels (TNC on). In other words, when I switch to my APRS memory channel, the radio automatically turns the TNC on and I don't have to do anything. When I'm done, I just turn to another memory channel. You can also manually turn the TNC on and off on any frequency you need.

73, Wes, W2EMO
www.w2emo.com

P.S. The unit does not have a mailbox which I don't see the need for anyway. Most people aren't going to leave the unit on in their vehicle 24/7 right?

Date: 2002-07-02 15:55:36 UTC
From: andrewiski
Topic: 234 Message: 234

Can Anyone help with a formula to calculate what size resistors I need to place in R13 or R27 to attenuate a 15VDC max input down to 5VDC max for a KPC 3+. Manual just says resistors are needed if Voltage is to exceed 5VDC Max use test point J and K to check this voltage. I am not sure what size resistors to start with. Hate to be to small and burn something out when trying to measure it a tap point J and K. Manual says it will handle up to 50vdc if attenuatted with resistors but gives no formula.

Thanks

Andrew DeVries

235. WINAPRS and PK96 and Ultimeter 2000 question

Yahoo group: APRS (1998 — 2006)
Date: 2002-07-03 00:02:39 UTC
From: wolobmp
Topic: 235 Message: 235

hello, just purchased a peet ulitimeter 2000 and a pk96tnc. using winaprs....and what i like to do is to run a WX aprs station. i have bought the aprs serial cable from timewave, changed baud too 2400 and clicked on wx settings within aprs. i have the parse-portion "signal" comming from the junction box and wired the 2 wires per pk96 manual. i am able too see aprs stations on the air...i have my station wx icon showing, but no data seems too be taken from the ultimeter 2000. i also when click on my wx icon station is doesnt show..open station weather chart and display weather info icon either. i think there is a toggle or setting or something in this line that the pk96 and winaprs isnt "talking" with the ultimeter 2000. the baud rates on all items are set at the 2400 baud recommended. the connection too obtain the "parse" information is taken off the junction box of the weather station and then fed into the sep plug that is off the pk96 serial plug cable.when i try too send wx info is says weather data is too old oris invalid(check cables). since only 2 wires used for this connection i dont think its that...but am not sure. any assistance here would really come in handy now!! i called timewave and they suggested too post this question here, and was told many people run this setup and would be any easy walkthru. appreicate any settings within winaprs or the tnc or anyplace else that might cause not too have the WX sent out over the air. thanks much for reading and hope someone is able too lend a hand here. 73...mike wd8bmp

240. Topographic maps of Canada

Yahoo group: APRS (1998 — 2006)
Date: 2002-07-24 20:13:33 UTC
From: ve2bap
Topic: 240 Message: 240

Hi fellow hams,
For those of you who want tu use maps of Canada for APRS or any navigation purposes, the canadian federal government offers FREE topographic maps for download on its web site. ALL Canada is at 1/50 000 and 1/250 000 scale; these are 700 kb .GIF files, which have to be downloaded one at a time (unless someone finds a way to connect it by FTP).

The address is: http://toporama.ctis.nrcan.gc.ca

On this web site you can also download satellite photos of most of the country; watch for "ortho images".

To use these maps with a navigation software (UI_View, OziExplorer, Quo-Vadis, etc), you need a calibration file for each map. They are available on another part of the canadian government web site: ftp://ftp.cits.rncan.gc.ca/pub/datum/nad83/

These are .DAT files, which is an unknown format (for me) that can not be used by popular softwares. I converted all of them to .INF calibration files, which can be used with UI_View for APRS (probably with WinAPRS also, I am not familiar with this soft). I compressed all these .INF files in two .ZIP file, and put these 2 files on this forum for download, so you can enjoy them. Files are:
BNDT_Toporama_50k_inf.zip (1910 kb) (1 / 50 000)
BNDT_Toporama_250k_inf.zip (150k) (1 / 250 000)

De-compress these 2 ZIP files and place .INF files in the toporama maps files folder. You can just extract the .INF files you need from the .ZIP files as well. For example, files 031h12.gif and 031h12.inf (Montreal at 1/50 000) should be in the same folder.

Ortho satellite images files have the same filename for the same geographic area. You can use the .INF files with these files. Place them in a different folder if you have the same area in topograophic version, since your software could get mixed-up with them.

I will try to generate calibration files in .MAP and .CAL format for OziExplorer and QuoVadis softs, in a near future. I will then put these files on this forum so you can use them.

If someone knows where I could find a software or a script that converts calibration files (.INF to .MAP or reverse), please let me know!

Please excuse my bad English. 73.

If you are using a laptop while mobile, yes. You could also use one of the kenwood radios, and a GPS the will accept the positions of the other stations from the radio. Depends on how much you want to spend, and how pretty you want the display to be! ;-)

245. Re: NEW VERSION WINAPRS 2.6.1

Yahoo group: APRS (1998 — 2006)
Date: 2002-08-05 23:44:03 UTC
From: Beischel
Topic: 238 Message: 245

If you want a full screen map, then spend another $16 and get UI-View. It now supports PM 5.0 so you get a better supported program, with a lot of add-on programs to make it do far more than any other APRS program...and the best part is the price. Updates and enhancements come out all the time.

Regards,

Duffy
www.wb8nut.com

p.s. - There is a Yahoo group for UI-View too.

Hello, I'm new to the list here. Been using APRS for over ten years on
our balloon flights, (http://www.mwt.net/~mayen1/educators.html) And
it's been foth a blast and valueable to have a exact way to know where
the balloon package is. In our earlier flights we did it strictly by
RDFing the paylload,, APRS is a lot better. No questions there.

But here is a question.

Check out the below address

http://www.ecoprimalquest.com/competitio/index.cfm

then click on the Launch GPS Tracker link.

This was indeed cool, A first for this sport, But it was not live.
The teams carried small gps units and periodically they had to stop
and download their travel data. So it wasn't really "Live"

There is a race that is getting organized locally and I was thinking
of making up some really small tracker units that I could give to some
of the teams and have live tracking.

Now heres the question,, With my balloon payloads we have done all
sorts of stuff from ATV, to repeaters, and lots of other stuff, and
most of the latter ones with APRS on board. Now,,heres where I'm not
totally sure of the legality here.

The racer of course most likely would not be a licensed amateur, If
they were to have the small package attached to them, would that be
legal?

How would that be different than having the APRS system in my car
beaconing it's position, but with my non licenced wife driving across
country. I can see here working her way across the country.

Anyway, what I'm mainly getting at is, if I was to make up a few of
these tyracking units and give them to a few of the racers, and we
tracked them via APRS, would this be legal?

Thanks
Joe WB9SBD

Yes the Rutgers Site seems to be down. I found it on the TAPR FTP site. The address is ftp.tapr.org. You have to do some searching when you log in (Use and anonomous login) anbut you will find the full program and the updates. Just look for 2.6.1 and dowload it and install. I don;t know about the reg. I don;'t have mine reg. But I would assume that it would continue to work okay.

251. New Garmin Rino GMRS/FRS/GPS radio yahoo group!

Yahoo group: APRS (1998 — 2006)
Date: 2002-08-14 05:20:49 UTC
From: Misbach
Topic: 251 Message: 251

I just created a new Yahoo group for the new Garmin Rino. If you have not heard or read about this new GPS device you are missing out. The Garmin Rino is the first GPS device to have a GMRS/FRS radio integrated into it. It also is the first GPS device to support the Peer-to-Peer Positioning, this patented technology makes it possible to transmit your location to a friend or family member.

What really separates the Rino from the rest of the FRS herd is the ability to "beam" your exact location to another Rino user within a two-mile range using the FRS spectrum.

Even if you don't have a Garmin Rino I think you will find this group useful and informative.

To go to the website or subscribe to the new yahoo group use the information below.

Website: http://groups.yahoo.com/group/garmin-rino
To Subscribe: garmin-rino-subscribe@yahoogroups.com

Thanks!

Matt

P.S. I've already got lots of links, files, pictures, calendar items, and polls at the new Yahoo group website. It's going to be a great group for all GPS users.

Hello Kevin, one question you need to ask yourself about putting a APRS system together for your mobile is 'do you want to be able to send and receive messages or are you interested in the tracking aspect'. If you want to be able to put a quality, lower cost system together you can use a Tiny Track II interface, a rig and GPS. You can add a lap top computer for tracking others.

I have set up a system I really like in my SUV. I have a number of pictures, some text and a lot of tips on the set up on my website under 'APRS Info' and I think you may be interested in it. The only short coming is that you can receive messages (when using your notebook) but you can not reply to them. That is not important at all to me but a system that works well and is flexible is. I also selected a OEM GPS unit with no display, it is about the size of a computer mouse and works great.

Take a look and if I can help you with any other information let me know.

Visit The My World of Radio Website at:
http://miked2000.home.mindspring.com/radioindex.htm

Look under "APRS Info". Hope this helps. You can also find links to the APRS software that most people are using. I also talk about building a interface cable so you can use your notebook computer for GPS or TinyTrack II interface at the same time.

Date: 2002-09-08 02:43:04 UTC
From: k1ltj
Topic: 259 Message: 259

I am new to APRS, but I have spent a good deal of time reading everything I can find. I am having a configuration problem. I almost have it working, but there are a few things I don't understand. I am using a KPC3+ in the GPS mode, with a Garmin Streetpilot III. It seems to work with the gpshead set for $GPGGA. This gives me lat/lon, and altitude. I also have a TH-D7A(g). When I look at what it sees from the packet sent by the other rig with the KPC3+ and Streetpilot III, I don't know where it gets some of the information, and how I can change it. For example,when I look at the output from the KP3+ and Streetpilot on my TH-D7A(g), in the first screen from the 'list' command on the TH-D7A(g), it reads 'GOOD/GGA' This looks as though it is coming from the GPS receiver. I would rather have a status text like 'Fixed', or 'Mobile' in this display, but I can't figure out how to configure the KPC3+ to allow me to put something else in here in the GPS mode. The second screen from the TH-D7A(g) list area, where many station seem to have a comment like their city, state, or county, my display shows '.5,M,-33.8' etc. This is part of the GPS sentence, no doubt. My question is, how can I configure the KPC3+ to display text of my chosing in this area? The rest looks good, and works well. Any help you may be able to offer will be very much appreciated.

Thanks
Al / K1LTJ

The SSID & icon selections are completely independent & have to be selected separately, but don't have to "match", e.g. your SSID can be -1 & still use the van icon. I use the
same SSID & icon (-8 & the truck, & -14 & the power boat) but there's no need to.

Is there a preferred SSID for a D700? I don't want to use -7 because I've already got that in my D7A.

Relatively early on APRSDos users could use the SSID to determine an onscreen symbol (Window$ users refer to this as an icon), but I don't believe any of the other versions ever supported this. In fact, I'm not even sure if APRSDos still does ... 73

I knew about the SSID version of the icon code. More recent practice has been to use a -7 for a D7A so that people trying to send messages to it would know that it had a very short msg display. I was wondering if there was a similar practice for the D700A.

The Tripmate will, provided you give it a kickstart. You have to send the
string "ASTRAL" to it after power up. This actually turns out to be pretty
easy, since the Tripmate spits out that very string while waiting to
receive it, so all you have to do is loop the transmit data to the receive
data and you're good to go. There are a couple of web sites that have info
on how to modify it.

The Earthmate will not, not without help. It sends out some binary format.
http://www.byonics.com (the maker of Tinytrak) has a converter that will
fix you up.

Hi all. A friend gave me an older KAM tnc he acquired, but he and I don't know anything about it. When powered up, an LED in the "bar graph" window lights, but that's it. I wired up a tnc-radio cable, and opening the squelch lights the 'busy' LED. I've tried connecting to it with Hyperterm, and I get nothing. The same thing (nothing) when using a Kanterm shareware program I downloaded.

I have no manual, and no idea what to try next. I've searched the web for anything I can think of, and nothing helps. Does anyone have any ideas?

Andy

That's the one. I couldn't think of it earlier.

>Even has diagrams to make a simple power supply using a 7805. It's well
>done. Hope this helps.

Note: You will have better performance if you use a 7806 instead of a 7805.
The 7805 puts out 5 volts, which is at the lower end of the usable voltage
range for the Tripmate. 6 volts is what it normally runs on (4 AA
batteries). If you use 6 volts, it locks onto the satellites faster.

>Doesn't the KPC3+ have an option where you can set the string you want
>sent to the GPS at start-up?

I believe that is found in the KPC firmware versions 8.2 and 8.3. (8.2 for
KPC3 and 8.3 for KPC-plus).

This is great information, but I have a similar question about the
EarthMate.

I was using one but the batteries failed in mid-trip like usual, and I
started using the power adaptor cable I had back when I had an older
TripMate- the one that plugs into the keyboard/mouse port on the computer.
However, my laptop lacks that socket so I took a Motorola cellphone
cigarette lighter adaptor and grafted a mini-din socket on it to substitute
for the port. It puts out 6.4v no-load and I assume it is also the same
under load since cellphones draw a lot of current when charging.

I also got cute and opened the EarthMate up and added a tiny green LED to
indicate when external power is applied and that the cigarette lighter
hasn't fallen out.

Well, it did work but sometime not long after I got it working, the
Earthmate seems to have crapped out. I can see the data flowing (using
Street Atlas) but the program insists it can't acquire a lock, inviting a
re-init over and over. I am using auto-detect AND also trying to specify the
EarthMate in the GPS selection. Neither works, and the Garmin GPS2+ works
fine.

Did I fry something using 6.4v? Is there any better way to test it? The data
"looks" good but it keeps sending these gobs of strings over and over. I
sure can't understand what it is saying!

(Also, when using the external power cable, do the internal batteries get
bypassed automatically?)

Thanks

It's tough to try to debug a setup through a reflector. Where do you live?
Best bet would be to locate someone close to you.

I have spend a few hours debugging setups.

Try this:
Set up the Hyperterm program for com 1 use. Put your 1 to 1 9 pin serial
cable from com 1 to the 9 pin on the KAM.

Set the baud rate to a low number like 2400.

Now turn the power on for the KAM. If there is any communication between the
TNC and PC you should see a character come up in Hyperterm or jump of the
cursor. Toggle the TNC power a few times. Hopefully you will see
something.

Ahhh, but 7806s aren't that common. If you are in a bind just put
a diode in series with the ground (center) lead of the 7805.
Germanium gets you about 0.3v "lift" on the output (i.e. 5.3v versus
5.0v) and a silicon gets you 0.7v lift. A led will also work, but the
voltage varies with the color and the candlella (i.e. if there are one or
multiple chips inside...) but it is a stable value).
So a series combination of a silicon and a germanium gets you 6v.
The voltage might not be exactly 6.000v, but it will be stable. And
when you are just replacing a battery pack, that's good enough.

I use an original KAM with my WinAPRS station, no problems and required no special setup. If you're not getting any response from the TNC with Hyperterm, then it may be broken or your cable may be miswired...

You can select any SSID ("-X") that you want. It has no significance. A lot of guys use "-7" for their Kenwood APRS HTs, the D7. I use "-3" for a station I have in MD, and "-2" when I operate from NY.

They have no particular significance and are unrelated to APRS icons which are selected independently of the SSID.

From: J. Rausch
Topic: 278 Message: 281

This is the rule of thumb I go by (any many others do to):

NO SID = Home Station
1-4 = Weather Stations or Telemetry
5-6 = Digipeaters
7-9 = Kenwood
10-13 = Portable Trackers, pedestrian, bikers, hikers.
14-15 = Mobile Trackers (I usually recommend 15 for mobile trackers)

You will also find many digipeaters using the 10-13 range as well.
It all come down to who wants to use what. There is no set specifics
for what to use where.

Hope that helps, 73's

282. GPS status monitor

Yahoo group: APRS (1998 — 2006)
Date: 2002-09-19 15:52:56 UTC
From: Jim
Topic: 282 Message: 282

Can anyone recommend a Windows-based program that I can use with my laptop/serail GPS setup that will provide me with a "dashboard" style display of GPS output. Something along the line of the GPS monitor included in DeLorme Street Atlas or the Navigator in Rand McNally Streetfinder software. I would like a visual representation of a speedometer, altimiter, compass, satellites acquired/signal strength, GPS NMEA sentences, etc. but without the added baggage of mapping software. It would be used to monitor the GPS output going into my TinyTrak-II mobile APRS station. Shareware/Freeware is preferred, but I would not discount low-priced commercial software.

283. Re: [APRS] GPS mapping

In the same vein as the last request, a friend of mine is looking for a Windows-based program that he can use with his laptop with a serial GPS plugged in the back that will provide him with a system equivalent to that of a Hertz NeverLost? (also known as a Magellan Nav 750) - i.e. somethignthat gives me turn-by-turn directions?

In addition I would like a visual representation of a speedometer, altimiter, compass, satellites acquired/signal strength.

Commercial software is OK, shareware using public domain map databases is better.

I don't know if it will help you any, but I have a program I wrote a while back that will display the NMEA strings as they come off of the GPS's port. You can download it free from my page at: http://www.ke4nyv.com and then just click on the software link.

It's very simple at the moment but I planned on making more of a navigation display such as just you described. That is on my already full plate of projects.

Trying to send a file of commands to the KPC-3+. Pacterm just keeps sending a portion of the file over and over. The manual sates that this can happen if the file is not terminated by and EOF (end of file) character (ctrl-Z).
Anyone have an easy way to add the EOF to the end of the file? I am using Microsoft Word to edit the .txt file.
Was also thrilled that I had to print out the manual from the PDF file on the CD ROM. Add the price of an ink jet cartridge to the price of the TNC LOL

Hi all,

Jason wrote:

>It all come down to who wants to use what.

Several years ago, I did a survey on the TAPR APRSSIG about this. I found that although local areas devised local "standards", there wasn't a real consensus on a national basis. As an example, the NY/NJ/CT area us-es -15 for digis (which, in retrospect, isn't such a great idea), -14 is generally used by truckers, -7 and -9 by D7a and mobile autos, etc.

As local APRS networks formed over the years, these conventions took hold in their individual regions, independently of other regions ... this was in the era before we were taking advantage of the internet. Everyone figured "their" conventon was just fine ... it had served them well for a long time, and there really was no need to change them.

Of course, at one time, SSID's also denoted which onscreen icon you were showing (it still does if you're using a dumb tracker). There used to be a listing of these in the APRSDos README/SYMBOLS.TXT file. 73

Hi Al, you need to set your BT or BeaconText to the following string:

BT !DDMM.mmN/DDDMM.mmW#PHG5555/comments or status

The DDMM.mmN/DDDMM.mmW is your longitude and latitude.

The very next symbol (the #) is where you put your icon's identifier, you can find a list of these on Bob S's site under the APRS spec sheets.

You can also find this info on my site at http://www.ke4nyv.com/aprs

Hope that helps, 73's

291. Getting my house on the right block!

Yahoo group: APRS (1998 — 2006)
Date: 2002-09-23 22:46:54 UTC
From: Andrew J O'Brien
Topic: 291 Message: 291

I am intrigued...

I used Mapblast to get my Lat/Lon (I do not have a GPS) to use in my IV-View set up. I did this by entering in my actual street address in the Mapblast web site. When I then look my callsign up on findu.com , findu.com's map has me a mile or so away from where I really am. So, I then tried the topo map that Findu links to, with that I could zoom in and click on a more precise map of my street, After clicking my location on the topo map I updated UI-Vire with my more precise Lon/Lat. I then checked under my callsign at findu.com. I am now on the right street but still on the wrong block. So it seems that either Mapblast maps at findu.com are not accurate and/or the topozone.com maps are not accurate. Anyone have a better map source?

Since such alerts are mostly regional (rather than International) are you proposing that they arrive in the form of bulletins like NWS bulletins?

300. Emergency Beacon

Yahoo group: APRS (1998 — 2006)
Date: 2002-09-27 13:38:51 UTC
From: n1xtk
Topic: 300 Message: 300

I want to test the emergency beacon feature on my Tiny Track II. Is there an established way to do this test without having the police, National guard, FBI, etc come knocking on my door 8-)?

Is there a established procedure if an emergency beacon is spotted?

I have searched the web and haven't found an answer to these questions. Any help would be appriciated.

73,
Keith

305. WinAPRS Igate configuration questions

Yahoo group: APRS (1998 — 2006)
Date: 2002-09-30 13:04:30 UTC
From: k0fj
Topic: 305 Message: 305

I have a newly registered copy of WinAPRS connected to my high-speed internet connection. Our club would like to I-Gate weather and mobile position into to the internet and APRS network. My APRSserv.txt file was corrupt, and I found a sample on this reflector to use.

Can anyone forward the settings I should use to gate info from our area into the network? Is there a way to not have the I-gate station map fill up will all the info from the internet connection? Also any suggestions on the type of designator to use for this I-gate would be great. It is the only I-Gate in NW Kansas. How often should the position report rate be set on the IP side?

I have read through the manual, but am not having much luck with these issues.

Thanks for the assistance.

Use Afilter to filter out internet data. Forget where to find it but comes in handy when doing bike rides and such when you are just needing a certain area and using a internet connection.

Yes, because by and large the TNC is not doing the majority of the work. Now if you were going to be using it as a stand-alone tracker, you would have some issues. But, if you're hooking it to a PC then the PC will be doing the heavy lifting.

You might try going to the TAPR site and downloading a newer copy of the program. It's up to APRS852 now.

Dan, IE 6 still would not display these JAVAPRS sites but I downloaded Netscape and I can view the maps. HOWEVER the 10.151 live map is always empty , empty even though my actual monitoring of 10.151 has several stations. At http://www.qsl.net/kd4sai/aprshf.html the HF map has just one station W3SMR-1 which is supposedly live. However when I check W3SMR-1 via www.findu.com the station has no reported postion. I can't figure out what is going on.

The problem here is mostly a result of Microsoft trying to take over the
world of Java with the Microsoft virtual machine. A decidedly inferior one
in my opinion. In any case if you install the latest java virtual machine
RUNTIME ENVIRONMENT ONLY NEEDED then you will see that map and all your
other Java things will run better. If you are not a developer then download
ONLY the JRE and NOT the SDK (Software Development Kit) which is big and
only for development use.

If you are running XP you do not even get a JRE with your system. They want
to convert everyone to the idiotic Active - X VIRUS CREATION MACHINE
standard.

316. UHF APRS digi in South Florida

Yahoo group: APRS (1998 — 2006)
Date: 2002-10-09 20:48:44 UTC
From: Steven
Topic: 316 Message: 316

Thanks to Robert, KE4MCL, we now have a UHF APRS digipeater in South Florida. It is currently located near 87ave and Bird Road but will be moving to its permanent home this weekend on top of the Bellsouth Building near Flagler and the Palmetto. The frequency for use is 441.125. The digipeater is currently setup as a RELAY so you must have RELAY in you packet path for it to digipeat. There will be a UHF I-Gate up soon so that you can see the traffic on the internet.

Steven

Hello All

I have an MFJ-1274 TNC that I would like to use for my home APRS station.

Will this TNC work ?

Is there anything I need to know regarding settings etc ?

And are there any firmware upgrades that will bring it up to date?

TIA

Hi Bill,

LIFO... There probably ARE firmware ROM updates for it
depending on what's in it now - when was it mfgr'd ?

I've used a 1278 for APRS w/no problems, I'm guessing
it (the 1274) won't have as many of the fancy B&W's
that the Kam (etc) has, but it should be VERY reliable.
Have never had problems using either a 1278 or 1270...
Although I have to admit that MOST of my experience has
been KISSing with TCP/IP (NOS)...

IIRC APRS set's all the MFJ TNC settings during the init.

I'd say GO-FOR-IT!, but please wait to get other input
just in case there's somnething I'm forgetting :)

As long as your TNC is connected to a computer, and the computer is doing the heavy lifting (IE: WinAPRS or aprsDOS) you should have no problems. If you decide to run a Digi with NO PC, I think you would find that older versions of the firmware would be limiting on the 1274.

321. APRS and MFJ-1278B / Garmin GPS-45XL

Yahoo group: APRS (1998 — 2006)
Date: 2002-10-17 03:39:50 UTC
From: Ed
Topic: 318 Message: 321

I have the MFJ-1278B and a Garmin GPS-45XL. I tied to set them up as a tracker but was not able to get the TNC to work with the GPS-45XL. The only time the TNC would send the data was after you turned off the GPS reciever. I had the GPS connected to the rs-232 port on the TNC. My question is should I try using the TTL port on the 1278B next time? I do know that using the 1278B as a tracker is overkill. I did build one of the TinyTrakII kits and it worked well with my Garmin GPS-45XL. I also plan on getting one of the Garmin GPS-16 units to use in a mobile tracker setup.

Thanks,

Ed Taylor, ka4vmp

322. Radio interface question

Yahoo group: APRS (1998 — 2006)
Date: 2002-10-17 22:42:08 UTC
From: Dan Skaggs
Topic: 322 Message: 322

Has anyone ever tried to use an Icom IC2100H as an APRS radio? I'm setting up an iGate here at the house using a PC, AEA PK-12 TNC and the 2100H. I'm having a bear of a time getting the interface wiring correct.

The interface transmits just great, but the TNC seems to be deaf. When I set my mobile tracker to test mode to transmit every 10 seconds, the S meter on the 2100H goes full scale, but the DCD light on the PK-12 never illuminates and I don't see any text on the terminal program that I'm using to monitor the TNC.

I bought a pre-built cable from MFJ only to find out that it only works with IC-2000 radios. I've created a home-brew cable where I used the output of the 1/8" speaker jack on the back of the radio and soldered into the pins for ground and receive audio going to the TNC, but to no avail.

Anyone out there who could share some experiences trying this setup? Respond either to the list, or to me directly at n7dls@....

Thanks in advance.
Dan - N7DLS

Well, you've probably thought of this one already but it's always the silly, easy things that trip me up.....

Since you are using the speaker output, do you have the volume turned up on the radio? Don't want it turned up too far, maybe about halfway as a starting point.

Haven't used the 2100H but we run into this when using our Kenwood TH22AT handhelds with a TNC.

For what it's worth.....

Good luck.....

Thanks Ron...

Oddly enough when I looked at the radio after seeing your message, the volume control is exactly 1/2 open. I had been testing the radio without anything plugged into the speaker jack to make sure it was receiving and that's where the volume knob was left when I plugged the interface back into the speaker jack.

I'm at wits end on this thing. The only thing I haven't tried is another radio/tnc to see if maybe my TinyTrakII isn't adjusted properly. Maybe I'll do that if I can find someone with a radio and TNC that I can use.

Thanks again
Dan

I have been using a 2100h since last March and no problems. I just plugged the cables in moving from an Alinco dr-140. Volume control about mid range. Tnc is a KPC3.

The DR-140 was good but had a birdie that wiped out the GPS.

438.100 is a second APRS freq. (together with DX-Cluster)
This way UiView can be appears into terminal window only DX-spots.
The network working now in Greece... APRS together with CLX /9600
Bps.

329. Alinco setup, new to APRS

Yahoo group: APRS (1998 — 2006)
Date: 2002-10-19 16:24:40 UTC
From: thomasrut
Topic: 329 Message: 329

Hi,
I'm new to this APRS and am having a hard time to get things working.
This is what I got do far.
At home I'm using a KAM3 and using APRS+SA trial version and it seems to work good, everyone showes up on the map but me. There is only about 4 other people on APRS in town now and I would like to add to that number.
Mobile I'm using an Alinco DR-135TP with the built in TNC and Garmin GPS 35 Series http://www.garmin.com/products/gps35/ . For some reason I don't see myself on the home APRS map. The Alinco seemsto transmit ok, here is what I see in the tnc window:
NL7TZ-1>GPSMV,RELAY,WIDE2
2:$GPRMC,030523,A,6129.0463,N,14941.9206,W,000.0,000.0,300902,022.6,E
*64
So I know it's transmitting and the unit at home is receiving ok but it doesn't show up on the map. I'm not sure if it is in thesetup in the Alinco, I did a search and found a few and tried them, that is what is in there now. If I do a reset tell me what to put in from there.
Thanks
NL7TZ
Tom in Alaska

Hi Tom,

When I check http://www.findu.com/cgi-bin/find.cgi?NL7TZ you are not listed. That means that you are not geting out , at least to the Internet. You could still be transmitting okay since not getting on to the Internet listing could imply that there are no stations in your area relaying you. Can you try to "ping" one of the other stations that you see on your map? I'm not sure what software you are using but you should be able to determine which stations you are hearing directly. Ping one of those stations and , if they hear you, you should get an immediate response from them

Thanks Andy,
How do I "ping" another station? I don't think the Alinco lets me see any other stations. The one in the house can see everyone but the one
in the car I'm not sure if there is a way to look at other stations. In the car there is no software, just the alinco and GPS. The one in the house uses an Icom 228h, a kam3 and APRS+SA for software. It works on everyone else but can't see myself on the map.

Thanks

If others confirm that they are seeing you on their maps, then that would be confirmation that the rig is transmitting. I am not sure why you would not see your self though.

I think your Alnico will support a PING command but I do not know what it is.

Here are the settings I use on my DR-135TP for tracking:
FLOW OFFGBAUD 4800GPSTEXT SGPRMCLOCATION EVERY 6LPATH GPSM VIA RELAY,WIDELTMHEAD OFFMYCALL K4SET-15LTMON 10UNPROTO APRS VIA RELAY,WIDEAUTOLF OFFECHO OFF

Obviously change MYCALL to yours and under LOCATION EVERY 6 - That equals one minute. That is for tracking. Increase the number as necessary

Also, check to make sure your GPS is set up for NMEA. I had the same general problem and that's what the trouble was - the GPS was sending information, just not in NMEA format that the Alinco will properly "decode". Check your GPS user manual for that setting.

Hope this helps.

Just a couple of prelimary things to check:

If everything seems to be set up and working properly, and your transmitter is keying properly when the mobile station is beaconing, first check to make sure your transmit frequency is correct (i.e., you didn't accidentally leave a repeater offset enabled like I did once before). Then listen to your transmitted signal with an HT or other radio and make sure it sounds like a packet. This may narrow down the possibilities.

Topic: 336 Message: 337

Guillermo,

Not all APRS software/hardware supports this, but sending ?APRSP to a station should result in that station sending out a position report.

The APRS spec lists the following queries:

?APRSP - tells the station to send its location beacon
?APRSS - tells the station to send its status text
?APRSO - tells the station to send its active objects
?APRSD - tells the station to send a list of stations that have been heard direct
?APRST - tells the station to send the route by which the query was received
?APRSH <callsign> - tells the station to send its information on when <callsign> was last heard

Hi to all,

has anyone experiance with Garmin eTrex & TinyTrack ?
I've connected the data-out of eTrex to data-in of
Tiny, but nothing happens... seems to do not receive
any data from GPS.

Thanks in advance

Mak

I cannot say if this is your problem but I have a GARMIN XL12. All GARMIN GPS units have to protocols for output. One is NMEA sentences and one would be the GARMIN proprietary mode. Most programs not created by GARMIN require the NMEA output. BE sure you have the correct output selected, whichever it needs.

I have the Garmin GPS-45XL and have not had any problems with my
TinyTrakII. I have the GPS-45XL set for NMEA output.
You can also check out the TinyTrak group here on Yahoo for lots of
information on the TinyTrak.

341. Tiny Trak II

Yahoo group: APRS (1998 — 2006)
Date: 2002-10-23 04:32:31 UTC
From: John Van Sandt
Topic: 338 Message: 341

I just got my Tiny Trak II put together and tried to run the config program. I can't get the computer and the config to talk to each other. I assume you have to have the tiny trak powered up. I tried all the com ports and only one said "tiny trak not found" (com port 2) all the rest said "com port not avaliable". All the lights flash on when its powered up. They even flash after its been on awhile, like its trying to transmitt, although I don't have any radio hooked up yet. The com port I have it pluged into is com port 1 but it says the com port is not avaliable. All solder looks good and the voltage regulator has an output of 5 V ....Help!!!!

John,

Yes you do have to power up the Tiny Trak in order to program it. You might want to post your message on the Tiny Trak Group also at the following address;

http://groups.yahoo.com/group/TinyTrak/

Hope that will help

Ed, ka4vmp

343. pocketAPRS and Kantronics?

Yahoo group: APRS (1998 — 2006)
Date: 2002-10-24 00:32:11 UTC
From: Bill Reid- VE3VWD
Topic: 343 Message: 343

I have a Palm IIIxe that I want to use with my Kantronics KPC3+.

I have the extra hotsync cable that you can buy for the Palm with a DB9 connector on the end and the small plug in for the Palm on the other. Works great for hotsyncing on the PC.

I went to the pocket APRS site and found that I needed a cable (http://www.pocketaprs.com/wiring.html) so I made one .

A DB9 male and DB25 male with the wiring as follows pin 2 to pin 2 , pin 3 to pin 3 , and pin 5 of DB9 to pin 7 of DB 25.

I have ohm'd out the pins and my cable is wired correctly.

My problem is that when running pocketAPRS , it say's it cannot see the TNC at all.

The TNC is configured to run with WinAPRS at 9600 baud and works fine with my laptop .

There is no data at all being transferred.

Do I have a wiring problem or a TNC setting error.

Thanks in Advance

Hi I run pocketAPRS sometimes with the same setup. I use a null adapter.
Works great that way. Use the cables you have now and get a null adapter.
Let me know how it works.

Reverse the 2 and 3 pins on one end.. You need a null modem type cable
to talk to the TNC

349. Update on the Alinco

Yahoo group: APRS (1998 — 2006)
Date: 2002-10-25 03:47:48 UTC
From: thomasrut
Topic: 349 Message: 349

Update on the Alinco.

First, I had to build an interface so I could tell if the Garmin GPS 35 was working and it was. Then I changed everything on the Alinco TNC and everything seems to be working now. I show up on the home unit and I see myself on FINDU.
Now I have to do the xyl's and see if I can get hers working too. Hers worked for one day when I first put it in her car. It sends packets but the lat and long are of the home QTH.

Thanks for all your help

UI-view has a 16bit version that is freeware. The 32bit version takes a small registration fee of around $15 US. There is lots of cool features in it that the 16 bit lacks. Down load the 16bit and see if you like it. It takes a little getting use to but it has great support.

I've never seen any place that the WX station identifier is editable.
I think if it's not one of the selectable station types in the setup
screen, you're out of luck. But do you really need to change the string?
Has the WX data string format changed between the w2k and the w21k?
As long as the other stations can interpret the data values...

The way to unsubscribe to any Yahoo list is to send a blank message to LISTNAME-unsubscribe@yahoogroups.com, in this case APRS-unsubscribe@yahoogroups.com using the same e-mail address you are subscribed from.

This was explained in the welcome message you received. If you are new to computers you should have saved this for later reference.

There is a bug in Yahoo that I have run into whereby sometimes it unsubscribes you yet continues to send you mail. Trying to unsubscribe again only gets you the message that you are not subscribed, yet the mail keeps coming. If you have problems you should e-mail the list owner APRS-owner@yahoogroups.com with exact details including what you have done and what has happened..

The addresses for all this can be found on the list home page http://groups.yahoo.com/group/APRS. This applies to all Yahoo groups.

Phil

On the back of the GPS there is a rubber cap. Pull the tab back and see 4 pins. From the back as you are looking down at them you will see a key (plastic rib) in between two of the pins. If you are holding the GPS so the key is on the left.. the pin just CCW of the key is +12 volt. 180degrees from that is - (power supply). To the right of those two is "data out" to the TNC. 180 degrees from the data out pin is "data in". I assume you don't have the GPS manual (The reason I go to detail).

Actually, I cant find the book for the KPC3+ and I don't know what pins to connect the Garmen data in/out wires to. There is a DB 9 and a DB 25. I know the DB25 goes to the computer so I will take a guess that it connects to the DB9....But what pins???

Try these two, one of them might work:
APRS-unsubscribe@yahoogroups.com
Aprs-unsubscribe@yahoogroups.com

On another list I was on there was a comment thread
involving the bug and one person said that the unsubscribe
capitalization had to match, another said that the first letter
had to match.

My wife says that PC stands for perpetual confusion.
Maybe she's right...

Hi Ed, The DB9 on the KPC is for the radio interface. I can get the pins for you out of my manual. The DB25 on the TNC is for serial in and out. You need to connect the Garmin to the DB25. If you do not want to make a Garmin cable, get a factory cable from a Garmin dealer. You will need a DB35 to DB9 and then a DB9 to DB9 NULL adapter to swap the TX and RX pins. I can go further into that if you need.

If you make your own cable, go to www.pfranc.com to get a Garmin connector and then all you need is a DB25 male connector from RadioShack and you can swap the signal lines before you solder them and eliminate the need for a NULL adapter.

Hope that gives you a start.

My orginal post...did'nt post.

Ed, on the KPC-3 the DB25 is for serial IN and OUT. The DB9 is your radio interface.

If you don't want to make anything. Go to www.thegpsstore.com or some kind of Garmin dealer and order a serial cable already made up with the DB9 connector. Then all you need is a DB25 to DB9 and then you will need a DB9 to DB9 NULL adapter to swap the serial TX and RX lines.

If you want to make somthing thats a little more custom. First go to www.pfranc.com and order some Garmin connectors then get yourself a DB25 male connector from someone like RadioShack. Now you can solder the 2 connectors together and swap the serial TX and RX lines and avoid the NULL adapter.

Hope that gives you a a start. I can go into further detail if needed.

The newest KPC3+ v8.3 are capable of taking the GPS signal in via a pin on the DB9. Allows you to still use the DB25 for the computer. Radio goes into the DB9 as normal, GPS signal goes between Gnd pin and an unused pin, 7 I think, but DON'T hook it up based on that. I don't have the book or the pinouts with me. I will look it up tonight and post it if somebody else doesn't take care of it before then.

You have to build a simple DB9-DB9-DB9 Y cable, not a HSP device, just a Y cable. Very easy. This is the way my KPC3+ is setup in the van and it works great.

Has to be version 8.3 or later though. Older ones can't do it this way.

Date: 2002-11-01 05:24:10 UTC
From: Ron Cluster
Topic: 364 Message: 365

OK, haven't seen anybody else post this so here goes:

KPC3+ v8.3 pinout for the DB9 from the Kantronics manual

Pin 1 Transmit Audio to Radio
Pin 2 External Carrier Detect *OR* GPS NMEA input
Pin 3 Push to Talk Signal
Pin 4 Cntl Line B
Pin 5 Receive Audio from Radio
Pin 6 Ground
Pin 7 External Input for Power/Reset
Pin 8 Cntl Line A
Pin 9 Ground/Reset

I only have connections to Pins 1,3,5,6 to the radio and pins 2,6 to the GPS

To use this method of GPS signal input you must NOT have the TNC set to "CD External". I use "CD Software" and can leave the squelch open all the way for better reception of weaker signals. You also have to turn this option on using the GPSPORT command in the TNC. I use "GPSPORT 4800 NORMAL CHECKSUM". Be sure to set your GPS to output NMEA at 4800 baud, not the Garmin Protocol that is the default. Most mapping programs will also want WGS84 as your map datum which you must set in the GPS. This can vary but the maps I have used in WinAPRS seem to be built to that datum.

Hope that helps.

Hi all,
I am having a problem sending out messages. I use to be able too but now I can't
I am using winaprs 2.51 and I am on tcp/ip. I send a message out and it just sits in the message list with Q in the AcK column and never gets sent, What does this Q mean?

Thanks.

Date: 2002-11-11 04:43:04 UTC
From: Ron Cluster
Topic: 366 Message: 367

"Q" means it is ready to send as soon as the previous message you sent to the same station is "Ackd" or acknowledged by that station. Look back up in your message window and see if there is a previous message to that same station that has not been acknowledged. If there is, and if you want to cancel it, single click on the message and press the backspace key. The message will get a "D" by it, which I guess means deleted, and then the next message in line will get sent out.

373. Unable to get SA to recognize comm port

Yahoo group: APRS (1998 — 2006)
Date: 2002-11-20 23:04:56 UTC
From: Darrell
Topic: 373 Message: 373

I have the D700 and a Garmin Plus III. The radio appears to work fine with the TNC and TX/RX mine and other stations. When connected to the computer, it appears to work fine with APRS as I receive other stations signals, and I guess they get mine. When I try to get SA7.0 to work, I get "unable to open comm port" and "no GPS detected" no matter what comm port I try or transfer setting I try (Garmin/Garmin, NEMA, etc...).
I think APRS is using Comm Port 1. I made the connection cable and it appears to check out.
Any suggestions?

374. APRS CE

From: Patrick Karp
Topic: 373 Message: 375

That is the only one available right now. You can still use it if you set the date back on the Pocket PC to before the Exp. date.

From: firstfactory
Topic: 376 Message: 376

Hi all !

On the recieving site, can a PC + TNC + GPSS map software -MV version-
decode data sent by Tiny Track2 ?
GPSS map : www.gpss.co.uk
Has anyone experimented with such setup?
Thanks

377. Igate software?

Yahoo group: APRS (1998 — 2006)
Date: 2002-11-24 16:39:12 UTC
From: Dakota Summerhawk
Topic: 377 Message: 377

I am looking at the winaprs Igate program and every time I try to connect to the only server listed it says it cant connect, anyway to get the regular Winaprs to be able to Igate? I can feed my info into the local server from here if I can get the Winaprs to Igate. I do have a regeristered copy of Winaprs so that will not be a problem. Any suggestions? I run windows so a linux or other OS is not going to work.

Thanks

Peter N0WRE

378. APRS Display Problem

Yahoo group: APRS (1998 — 2006)
Date: 2002-11-24 23:25:18 UTC
From: John Van Sandt
Topic: 377 Message: 378

I have 2 APRS mobile stations. The one with Tiny Trac II does not show up on my other mobile unit which is a Kenwoood TH-D-7 and a handheld Jornada running APRS-CE. (The Jornada is back dated to allow the one and only APRS -CE beta version to run).
The Tiny Track II does show up on Findu.com no problem but will not show on the screen of my other mobile even if its parked side by side in the garage. It only appears if it is digipeated on another digipeater (which is down right now). What do I have set up wrong?

What model do you have?

I havn't had any problems with mine. Just make sure you have the correct port and such in WinAPRS. I did have to modify the txt file that contains that info for connecting to the TCP/IP in the WinAPRS directory to get it to work. The one that comes with WinAPRS didn't work for me. You shouldn't have to route the ports to the computer either.

I run with DHCP server assigning my IP addresses for me.
If you need the txt file I modified for my setup let me know and I'll attach it so you can put it in the DIR and see if that helps. Other than that, it should work for ya with no problems. I even use Afilter and it works with out routing ports to the computer.

> router. I have DMZ enabled and it still doesn't work.

I've had trouble getting the linksys DMZ settings to really behave.

You have a server behind the firewall and you're trying to access it
from outside? first of all, have to make sure you're using the external
IP of the router, not whatever IP the computer thinks it has. Secondly,
make sure you can access that IP at all from the outside - some
dsl/cable providers don't give you a real routable IP address at all.
if possible, try it without the router first...

385. PMAP and Windows XP

Yahoo group: APRS (1998 — 2006)
Date: 2002-11-29 21:34:41 UTC
From: kilroy73
Topic: 385 Message: 385

Hi,

I've upgraded to Windows XP but I cannot get the PMAP_OCX stuff to 'register' itself. I've searched Google for HOURS on end and cannot find what I am looking for.

I've modified the PMAPOCX.BAT file so it works with the C:\WINDOWS\SYSTEM32 directory (for Windows XP) but all I get is an error message (when I run the BAT file) that says:

LoadLibrary ("MAPOCX.OCX") failed - The specified module could not be found.

I am absolutely sure that the MAPOCX.OCX and OC30.DLL files are in the C:\WINDOWS\SYSTEM32 directory.

Anyone been down this road (and have a solution)?

THANKS!

- Gerry (KB6OOC)

387. PocketAPRS & Kantronics KPC3+ "ever"

Yahoo group: APRS (1998 — 2006)
Date: 2002-11-30 16:18:44 UTC
From: Bill Reid- VE3VWD
Topic: 387 Message: 387

Hello All

Has anyone "ever" got a Kantronics KPC3+ ver 8.3 working with PocketAPRS v1.9.
There are two of us in our club who have the same equipment and the same
problem.

-We can initialize the TNC as a KPC3. We have tried all selectable TNC
options also....

-We can receive packets.

-Users do show up on the map.

-We are "not" transmitting using the Palm

-The Red LED never comes lights on the TNC. "see Note at bottom"

-We can not get to "CMD" mode in the terminal window of the
Palm .... we have tried selecting control C 3
times using the features option

-We don't seem to be getting GPS packets through to the TNC from the GPS
I suspect that it is because we can't get the interface into GPS mode

Note: The TNC / GPS works flawlessly when hooked to a laptop. The TNC does
transmit when "it" wants to... but not for messages or when we request it
to send our position etc.
It appears the TNC is still running from a previous WinAPRS hookup as it
transmits our position related to where we were when the laptop was hooked
up...

P.S. Anyone know how to get a Kantronics to stay in Interface GPS when
the power to the TNC is removed and reconnected "Not the power switch
turned on and off"? Always reverts to Terminal mode !

TIA

If you are connecting the GPS input into the DB9 port with the radio using the "software serial port" method introduced in v8.3, you want the TNC in terminal mode. You would use GPS mode only if you are connecting the GPS to the DB25 port on the TNC.

You need to turn the second serial port on by using the GPSPORT command.
Mine is GPSPORT 4800 NORMAL CHECKSUM
The "4800" needs to match the comm setting in your GPS and the GPS needs to be set for NMEA output. This only allows you to receive data from the GPS, you cannot send it anything.

You also cannot have CD set to EXTERNAL if you are using this method. I use CD SOFTWARE which then allows me to completely open the squelch on the radio.

I haven't used PocketAPRS so can't offer any help there.

Good luck Bill, hope that helps.

Try this...

Open a cmd window and navigate to the c:\windows\system32 folder.
Once there, type in 'REGSVR32 MAPOCX.OCX' without the quotes.

be sure you use tabs and not spaces between "columns" in your new
entries. This is true for all the text files in winaprs. Use of spaces
causes all kinds of weird problems.

Well, THAT's certainly good news!! Thanks Mike. Any more details on that you can share?

I'm hoping that either Garmin or Kenwood will see the light, and come out with a 2m/TNC/GPS/Map all in one. Preferably able to accept decent maps like the newer Garmin GPS units. Kenwood came close with the D7, just needed an integral GPS and I guess there were some fairly minor problems to do with messaging that need fixed.

I think they would sell thousands.

397. RE: [APRS] Garmin Rino 120 and APRS

Yahoo group: APRS (1998 — 2006)
Date: 2002-12-07 23:28:49 UTC
From: Mike WA6ILQ
Topic: 392 Message: 397

Can't say any more at this time.
The folks involved want to keep a low profile until it is determined that:
a) the conversion is possible
b) the conversion is practical (i.e. the synthesizer can be placed on useful frequencies)
c) the conversion doesn't take weird technology (surface mount for the inexperienced is a PITA)
d) the conversion is repeatable by folks with normal skills
e) Garmin's legal staff isn't going to hassle them - as it turns out there are copyright notices all over the firmware.

Let me tell you - if those conditions can be met, you will hear about it.

And that's all I'm going to say.

One possibility that came up recently was the possibility of an intermediate step...
... tapping into the audio lines going in to and out of the Rhino's radio section and
then disabling the RF section. Using the Rhino as a user interface to an outside
radio via that radios speaker & mic jacks might be interesting.

This thinking started when a comment was made that you can find older handhelds
like the HTX202 and 404 on ebay for under $100...

Mike

PS - folks need to send emails to sales@... and ask when a version
of the Rhino that will work on 144-148mhz amateur radio channels will be available.
And don't say "if" but "when"). And don't say "thousands" - that's not enough of a
market. They need to sell at least 100 to 200 times that.

At 02:45 PM 12/07/2002, you wrote:

398. APRS 1000 Mile Question

Yahoo group: APRS (1998 — 2006)
Date: 2002-12-07 23:30:07 UTC
From: John Van Sandt
Topic: 392 Message: 398

I am running Pocket APRS with a Kenwood THD-7 and have noticed some station reporting on my screen from a 1000+ miles away. I llok at their path and find they are using "TCPIP" and then the call sign of our local digi. Does this mean they are going over the internet and then being repeated by our local digi? If eveyone did this would this cause a problem? Common sense appears as it would cause issues but common sense was never my stong point.

--- In APRS@yahoogroups.com, John Van Sandt <n9yrx@y...> wrote:
> What you are seeing is someone in your area is outputting from the
Internet stations.

There are two ways this is accomplished. The first way and somewaht
useful in rural areas to advertise that APRS is in the area ther is a
setting that when local traffic slow way down and beacons are
somewhat seldom if a Digi is connect to TCPIP it will transmit random
stations from afar to stimulate the systems in the slow area and then
when traffic picks up due to say proagation enhancments is slows or
stops completely a very useful tool.

The second and most useful method is a setting called "Lists" and you
can put your favorite APRS friends callsign and if he goes someplace
far or your own mobile if you are going to a distant place for
vacation and this will output this list out of your digi (provided
you are connected to the iternet with your digi)where evr you guys
are and your station somehow makes it into a digi connected to the
internet and believe me there is one somewhere near you.

Hope this helps.

400. RE: [APRS] APRS 1000 Mile Question

Yahoo group: APRS (1998 — 2006)
Date: 2002-12-08 00:01:00 UTC
From: Ron Cluster
Topic: 392 Message: 400

Hi John,
If that 1000 mile away station sent an APRS message to a station in range (defined as within 2 hops I think) of your local iGate, the iGate would gate the message out to RF as well as 1 position packet from the 1000 mile away station. That's so whoever receives the message can also see the senders position on their map. The iGate shouldn't continue to gate all packets from the sending station.

I can also put a stations callsign in my stations.txt file and I will iGate everything that station sends. So if a local ham is making a cross country trip, I can put his position out to RF for all the hometown folks to see.

Yes, that is what "TCPIP" means in the path. Yes, if everyone was operating as an iGate, it would overload the network I think. You only really need an iGate every couple hundred or so miles, maybe more, varies by terrain I suppose. I don't have a lot of experience with being an iGate, only my third day. I'm primarily putting the NWS warnings out to RF for our local area.

401. Tripmate GPS question

Yahoo group: APRS (1998 — 2006)
Date: 2002-12-08 10:17:30 UTC
From: ve7ltd <dcameron@irlp.net>
Topic: 401 Message: 401

Is the Delorme Tripmate waterproof? I am trying to find more info on it, but since Delorme now basicly denies its existance, it is hard to find.

I want to mount it under the skin of my bumper, but want to know if it can take the punishment of being outdoors?

Does anyone else mount theirs outside? Have and tips on sealing it better?

I must admit that a $70 Delorme seems much nicer than a $200 GPS-35 for the same job (hooking to my D700).

It does have NMEA out but I have not tried to get it working with the tiny trak. I am working on getting it on 144-148mhz at the present time. Also seeing what can be done with the firmware .

Dave

Always assume that its not. Try going to this site to set up the unit first. http://www.wes.johnston.net/aprs/tripmate.htm

I would put the entire unit in a zip lock baggy, poke a hole for the wire(s), leave the zip lock sealed. You may want to put electrical tape over the baggy to keep it tight against the GPS.

Get a small plastic/metal box , big enough to fit the Tripmate. Get a caulking gun and a tube of silicone sealant.

Put a layer of silicone about 1/4" thick on the bottom of box then set in the Tripmate. Start filling the box till unit is covered.

Do not bring wires out in a bundle, separate them so sealant gets around all the wires. You now have a "Some what water proof" Tripmate and can get it out if you need to repair it.

As long as you don't modify much of it... It was ment to go outside on top of the car. However, I have never seen a mount that made it stick outside. It was rumored there was a mag mount for it...

There is a rubber gasket that goes between the battery compartment and the GPS itself. I have a TTII mounted in mine and I made a new DB9 that caries the data and audio and power lines down the DB9 to the radio.

SO, to answer you... I would say yes. However under the skin of your bumper may not work as GPS works with a line of sight and any covering can cause it to be slow to acquire if it acquires at all. The best place I have found is the rear deck of cars or there abouts. If you dash board allows to be on the dash of the vehicle. The Tripmates don't have a really sensitive reciever in them.. Doesn't take much to block the signal. However you find a good spot to mount them and the work just as good as any other GPS recievers out there.

Well, nice to know it has NMEA out.. But I am not much of a electronics person. But those are FRS radios. Which tells me the reciever is down in the 460s. Getting the radio to transmit in the 144-148 band would take some interesting feats as it's a different band. HOWEVER, setting up a crossband repeater would be ideal! Setup something in the 440 range to crossband back to APRS. I have played with this idea to allow those who use both bands of their radio only to find that the other band is in their way. Then you could go in at either on the 2meter side or 70cm side to get back into the APRS network.

9600 was a thought at one time but the packets are so short would take the same amount of time to xmit 9600 as it would 9600 then the tuning of radios and modems...

There is some 440 APRS traffic. Might be easier to get it to go in
that range

I rarely post to this group, please bare with me.

I remember reading part of a msg one time that a member said he was using a Bearcat scanner to Igate with (recieve only) and that he had the out/sound connected to his modem.

If someone could point me to a website or other info that would describe how to do this in more detail, I would appreciate it. I think it worked on the basis that there was a particular software that could decode the APRS data. I think the software only worked with modems that contained a specific microchip.

Waiting to be enlightened!

de K4PCB

I dont beleave connect a scanner directly to a modem. However you can connect a scanner to a 16 bit sound card in your pc and use AWG to act as a software tnc. Then use any of the APRS packages that support AWG to finish creating an Igate. With this method you could allow a non ham to play with APRS too. you can download AWGPE from http://www.raag.org/sv2agw/ its free to use and works really well.

I believe you can connect a scanner to a KPC3+. Don't
think it cares where it gets the audio it works with.
Just wouldn't be able to transmit with it. And, it
should work with most software.... I think.

413. Serial Port Data Y

Yahoo group: APRS (1998 — 2006)
Date: 2002-12-13 17:26:15 UTC
From: Andrew DeVries
Topic: 413 Message: 413

Can any one help in writing Windows Device Drivers? I would like to write a Serial Data Y to split the data stream from the GPS or the TNC into two virtual COM ports. That way we can run more then one program to use the gps data stream. I would like to write it as open source to the ham community. I have downloaded the Window Device Driver SDK but am not really sure on how to start this project. I think the correct way to do this is to create a Device Driver that will emulate 2 virtual ports then a small executable that when running will open a real com port and pass the data onto the two virtual com ports. Can any one get me pointed in write direction as to how to get started with writing a Serial Emulation Device Driver? The DDK has a couple of Driver samples but they are more for real serial devices and not virtual. Any help would be appreciated.

I

Very interesting concept.

However, I don't know if you need to do this IF the laptop/computer actually has 2 comports. I have split the GPS output of a Garmin GPS2+ to 2 laptops running Street Atlas by using a serial "Y" cable available at computer fests. I only used the ground and data out pins, I broke off the others to reduce the chance of serial ports arguing.

If you only want the serial data from the GPS, you could feed it to 2 hardware comports, possibly. OTOH, if you need 2-way communication or gave a laptop with only one port, that's another story.

Thanks

You might encurage the Aprs program writers to share the gps data with other programs instead. This will allow you to share the gps data from a thd700 with some atlas programs. The only consideration is that you might need to create fill packets of gps data to satisfy the maping program. UIview32 allows this feature. However I have not tested it. Its a great Idea. I just dont think having another program handling it would be the "best" way. However sometimes its the only way. hehe

Very few laptops ever had two serial ports, and even the one serial port is starting to go away. The next generation of outboard equipment like GPS receivers is going to have to start switching pretty quickly over to USB ports or have a built-in Ethernet hub (or Bluetooth - now that would be sweet).

Yahoo group: APRS (1998 — 2006)
Date: 2002-12-16 16:49:02 UTC
From: Andrew DeVries
Topic: 413 Message: 418

The Idea here was to make the source code public so all of the aprs programmers could add it to their programs to allow them to share the GPS data stream.

If you have APRS+SA running with a serial link to the TNC then split that data stream to a virtual com port then you could open Street Atlas and tell it that there was a GPS on a Virtual Port. APRS+SA would send the ctrl E and the TNC would respond with a GPS String. This would allow for the Voice direction functions of Street Atlas to work plus give you the APRS position overlaid on the map. This would reduce the disk IO when you turn up the refresh rate as well. I also have a Large LED Sign that I want to mount in the back window. I have already written an app to update the sign with Speed, Heading, Distance to last heard station, ETC. But with no way to split the GPS data Signal it makes it hard to share the signal with three different apps and the TNC.

I just need help writing the Virtual Device Driver. I have never written a device driver and all the sample code is for real serial devices not virtual devices so its giving me problems in where to start. So if anyone knows a person who could help or could help them selves it would be appreciated.

I think WinXP has these drivers already! I don't know about any other OS. However the author of UIview32 has this option in it. I have never tried it so I don't know if it works in win 98. But as far as I know he did not create the drivers. He's just allowing his program to work that way. I'll check around and see if I can find any info on this. I thinks its a great Idea but believe it has been done already.

I'm using a Garmin Colormap 3 GPS and have been in a "regular mode" as of lately: work, home, work, home etc.

I don't want to leave my color map GPS on all day so I've programmed in manual position data (especially for work). I like to leave the radio on to recieve messages.

It appears that the radio does not transmit location data as it is set on automatic with say a 30 minute interval. I would assume the 700 would continue to broadcast your position although it is being derived from a source different from the GPS.

Any comments/suggestions would be appreciated.

Thanks, Kevin K4PCB

425. configuring icons in KPC9612+Garmin eTrex

Yahoo group: APRS (1998 — 2006)
Date: 2002-12-23 03:22:01 UTC
From: Neville Cross <displicente@yahoo.com>
Topic: 425 Message: 425

Hello,

I am Neville, from Nicaragua. I am starting to experiment with APRS. At first I have set up some packet nodes to send beacons with coordinates and later to include icons. I have the closet nodes under my supervision and I can spot all of them in the map.

Now I am trying to track vehicles. I set up a KPC9612Plus with a eTrex in my car (no PC). It was a straight forward job, and worked at the very firts try. The problem is that on my screen it turn out as a Yacht. I am clueless in this matter, I haven't find any way to select wich icon will be sended. Not in the eTrex that gives the NMEA, nor in the TNC with the parameters BLT, BLT LTP or GPSHEAD.

Any advice?

Thanks in advance.

Topic: 430 Message: 430

Hi,

I just aquired the Kenwood TS-2000 and the Kenwood TH-D7Ag, and I am attempting to get an APRS program up and working with the TS-2000 and later the TH-D7Ag when my cables come in so I can hook up my gps and go mobile, but I need a spot of help.

I have tried Ui-View and WinAprs + SA. I can't get WinAprs to communicate with my tnc on the 2000 using serial port #2. Port 1 is already in use for other things. I don't no if I have a problem with the setup in the Kenwood or WinAprs.

Ui-View on the other hand did work somewhat after I downloaded a configuration file from another fourm. Problem is the config file is goofy it shuts the sub band off when exiting the program and it wrote something to the tnc that kept it from working Sky Command. It was a major problem to get the tnc back to it's orignal state.

I need to know which program that you think I should use and why. I'll need settings for the 2000 and the software as well. I would humbly accept any advice, tips, tricks or other uses you may have found for the program that you suggest. Please help if you can, as I am at a loss.

Thanks and 73's

James, as far as figuring out what/which com ports are working/to use, you're on your own on the pc side. When you do have a connection to the 2000 there will be and alpha "pc" appear on the screen on the upper right hand side of the aprs frequency display. (I use the sub-band for data).

Here are my 2000 menu settings.

46 Sub band
47 1200 baud
48 DCD sense

55 ON
56 9600 Baud

Good luck

Eddie

On the KPC3+ with version 8.3 firmware you connect your garmin to the 9 pin port, GPS+ to Pin #2 and GPS- to Pin # 6. This is the same port where your radio connects to.

434. Help--GPS & TNC

Yahoo group: APRS (1998 — 2006)
Date: 2002-12-29 19:46:41 UTC
From: Lloyd Stallkamp
Topic: 434 Message: 434

I'm trying to connect a Garmin 12xl to a Paccomm Tiny-2 TNC and a radio as a stand alone unit (no computer). The Garmin sends out the correct codes ($GPGGA, $GPVTG) as verified when hooked a terminal program on the computer. The TNC talks to the radio ok . In the TNC, GPSTEXT is set to $GPGGA and LG1TEXT is set to $GPVTG. The BAUD rate is all ok (everything at 2400). But when I set GPS ON in the TNC and hook the GPS to the TNC the GPS data doesn't get parsed and all that is transmitted is the message I've loaded into the LTEXT buffer. Any help would be appreciated.

Thanks,
Lloyd, KA0ADZ

438. GPS Info

Yahoo group: APRS (1998 — 2006)
Date: 2003-01-01 22:33:01 UTC
From: Jim <N2IXD@netzero.net>
Topic: 438 Message: 438

Has anyone been successful hacking the OEM GPS board in a Magellan GPS Companion for PALM-V unit so it will work with TT-II or a TNC? These units are selling in the $20 to $50 range on e-BAY. Does anyone know if the GPS board in this unit has TTL or RS-232 serial output and does it send out standard NMEA data sentences? I've been using a GPS board out of a Rand McNally StreetFinder GPS for PALM-III for some time now with good success, but I'm looking for a suitable replacement.

Happy New Year to all

Jim N2IXD

439. Kam Plus and WinAPRS

Yahoo group: APRS (1998 — 2006)
Date: 2003-01-02 12:40:05 UTC
From: James C. Hall, MD
Topic: 439 Message: 439

Hello:

I'm new to both the group and APRS. I got a Kenwood D7A for Christmas and have had great fun toying around with the built-in TNC and APRS. APRS activity in this area (EM56) is rather sparse, so I thought about setting up my old Kam Plus with FT-8500 on APRS. I presently make use of only the VHF port of the KAM and its attached to Com1 of my computer. I downloaded WinAPRS and upgraded to the most recent version. I have had little success getting the KAM to talk to WinAPRS - can't receive or transmit anything. On my part, there is considerable confusion about the line in the documentation that says something like - you MUST use the HF port, even if you use VHF only. Huh ?? Does that mean I have to somehow hook up the '8500 to the HF port of the KAM ?!! In the program, I have selected HF (dual) port everywhere it asks for it and have, I think, configured everything properly. Do I have to have the AGW interface going with this setup ? I assume I choose Activate VHF port but nothing shows on the terminal window and nothing transmitting either. Just to be sure, I checked the KAM by using a host mode program, kaWin, and I was right away receiving the packets - everything there works fine.

Can somebody give this newbie a helping hand ?

Jamie

The Sprouls are not doing much support on WinAPRS anymore. And the web site has been down for sometime. I would love to see someone take over the development of WinAPRS that can devote more time to it.

442. Setting up first tracker

Yahoo group: APRS (1998 — 2006)
Date: 2003-01-02 20:23:44 UTC
From: Jason Hissong <jhisson1@columbus.rr.com>
Topic: 442 Message: 442

Hi Guys,

I am currently working on getting my first tracker going. I have the interface between the TNC and the radio working and the interface between the GPS and the TNC working as well. I get NMEA strings from the GPS and they are transmitting over the air... however, the positions are not being updated... this is one of the strings I receive:

$GPRMC,000200,V,4001.2804,N,08308.9773,W,0.000,0.0,290697,5.9,W*6E

The tracker ID is N8XE-9 (http://www.findu.com/cgi-bin/find.cgi?call=N8XE-9)

I see the "V" in there which means that there is a receiver warning (what could that mean?) Could this be the reason that I am not getting any updated positions while I travel? I will be stopping by Radio Shack today to get the appropriate adaptor to connect the interface from the GPS to my laptop and monitor the GPS unit itself. (This way I will not be causing QRM if it looks like I am fixed).

I am using a KPC-3 v6.0, A Rand McNally Palm III GPS unit that someone gave me. You simply wire pin 3 and 10 to the appropriate pins on the DB25 connector. It defaults to NMEA sentences.

Anyways... just looking for a good place to start...

Jason Hissong
N8XE

443. NWS tab says to enter "Zones/Codes"

They refer to County Codes used in reports issued by the National Weather Service (NWS). They are used by APRS to parse NWS weather warnings put out via internet or RF and highligh (sometimes with color) Counties affected by that NWS bulleting (Watch, warning, etc).

Take a look at this site for a better explanation and links to the codes:
http://www.aprs-is.net/Wx/

Hope this helps, 73

Jason,

The "V" indicates that the GPS has not gotten a lock on the satellites and therefore, the position reported is not accurate (it just keeps reporting the last known position until it gains a lock again).

Are you using the GPS indoors? Outdoors? Underneath anything? When the GPS has a lock, the "V" will change to an "A".

Aside: I wish there was a Staples in my area so I could have loaded up on those Rand McNally Palm III GPS modules when they were on clearance for $10!!! I have one currently and it's a great no-frills NMEA-outputting GPS receiver.

Thanks Terry:

I fanally figured things out. The problem that was occurring was the KAM was holding on to host mode and not going to terminal mode. After re-attempting to initialize the TNC, it finally took and all started working. A friend of mine is still having problems with his AEA dual-port TNC and I suspect the same problem -> reluctant terminal mode.

Happy New year,

I'm interested in setting up a dedicated APRS station.. As all my existing gear is tied up, I am starting from a clean sheet of paper..

I'm looking for reccomendations on:

TNC - Good/Better/Best

Rigs - Good/Better/Best

Software - Is there any software I can use with Linux that is well maintained or is the best solution Windows?

Any other pointers?

Thanks in advance..

I don't know anything about linux, but WINAPRS is used by many many people worldwide, I use APRS+SA and love it. The best TNC is a new Kantronics KPC-3+ but for home use the software does all the work so most any TNC will do, I use a MFJ1270 from 1985 all the time. I also use a DR-135 alinco with the built in TNC and it works great. very clean setup with high power(50 watts) I also sometimes use my Kenwood TH-D7A(G) for a home TNC and It works great as well. Good combo for use with a laptop computer. Most any 2 meter rig will do just find for 1200 baud packet while hooked to a TNC. Just pick one that fits you the best. I use a GE MVP at 20 watts on my Digipeater http://map.findu.com/fieldr and it runs 24 hours a day with no problems. Payed $35.00 for it. TNC was $90.00 off Ebay.

KPC TNCs seem to be preferred. You can run them in CD SOFTWARE (open squelch) mode which improves response. Since the PC does the heavy lifting, the level of firmware isn't critical.

>Rigs - Good/Better/Best

Alinco DR-1200T is a good performer and easily available on the used market.

>Software - Is there any software I can use with Linux that is well
>maintained or is the best solution Windows?

http://www.xastir.org/ - xastir is very popular and well supported in the Linux world.

Since there is a "K9" object in the software, I'm presuming
that someone has used APRS for that purpose at SOME time.

I'd like to build a small harness for my medium sized terrier
that would place a small TNC, GPS Rcvr and low-pwr Transmitter
(or xcvr) on his back, with a range of a couple miles at most.

I might even consider using MURS or FRS for this if necessary,
and I can find a small/light enough unit. This would also
make it possible to detach the tranceiver easily and use it
as intended, or have the VOX turned on so that voices around
the K9 can be heard and responded to remotely.

The hardware would need to be powered from two 4xD-Cell tubes
integrated into the harness (12vdc) on each side of top center,
so the smallest current drain would be best.

Cost is a major consideration for this.
A small FRS HT can be had for ~$10-15 (with it's own pwr source),
and that leaves the TNC (maybe a BayCom chip type @ ~$30-40) and
the GPS rcvr - of which I have no idea of the minimum price for
a unit capable of interfacing with the TNC...

Your thoughts (and links) are appreciated.

If FRS or GMRS will work for you then go to
www.garmin.com and have a look at the Rhino. Or, build
yourself a tinytrak tnc and use a Pharos gps with one
of the minature 2 meter jobs from Alinco. Can't
remember the radio model number but it's Alinco's
credit card size radio.

Yep I have used it for the pack that my pooch wears to be able to track
her when she runs off into the forest. Tracker consists of a gps, and the
D7. Tracking is done with my handspring with a G71 and the shinemicro TNC.
It is a nice way to keep the pooch on a really long leash! Hi hi.
Dog tracking is an art to say the least!
Any questions let me know.

Subject: [APRS] APRSdog ?

Since there is a "K9" object in the software, I'm presuming
that someone has used APRS for that purpose at SOME time.

I'd like to build a small harness for my medium sized terrier
that would place a small TNC, GPS Rcvr and low-pwr Transmitter
(or xcvr) on his back, with a range of a couple miles at most.

I might even consider using MURS or FRS for this if necessary,
and I can find a small/light enough unit. This would also
make it possible to detach the tranceiver easily and use it
as intended, or have the VOX turned on so that voices around
the K9 can be heard and responded to remotely.

The hardware would need to be powered from two 4xD-Cell tubes
integrated into the harness (12vdc) on each side of top center,
so the smallest current drain would be best.

Cost is a major consideration for this.
A small FRS HT can be had for ~$10-15 (with it's own pwr source),
and that leaves the TNC (maybe a BayCom chip type @ ~$30-40) and
the GPS rcvr - of which I have no idea of the minimum price for
a unit capable of interfacing with the TNC...

Your thoughts (and links) are appreciated.

73 - Bruce

Topic: 453 Message: 459

I've been doing a little more research on this and found
the TinyTrak-II for about $30, which is 'within-budget'.
Any comments on that unit ? Or regarding the GPS or TX
hardware ? The Kenwood TH-D7* is NOT budgetable :(

Is there a High-Stability, Low-Consumtion 2m (or thereabouts)
PCB (or IC) transmitter available for custom building ?
Doesn't need to have a fancy case or display, and rockbound
or synthesized frequency (DIP Selectable) would be fine.
Stability/Width should be a minimum of 5ppm/11.25khz
with an emission type of F1D or F2D (if used on MURS),
or slightly less constrictive if using Amateur Radio.

What is the least expensive GPR rcvr that has an output
compatable with a TNC or TinyTrak encoder ? Can they
be found as a 'board only' unit for custom enclosing ?
I'm thinking along the lines of an aluminum housing
for all three components measuring about 10" long,
an inch or two high and maybe 2-3" wide, with com-
partmentalized shielded sections and a weatherproof
rubber ring sealed cover (on the long/wide bottom side)
held on with MilType spring latches... The enclosure
isn't a problem, and I have just the source (old dryer)
in mind for the metal - although that would be light
steel, probably better at shielding, and not that much
more weight... <WOOF!>

73 - Bruce

PS: Btw, noticed in the APRS852 docs that 28.187 LSB
is the 10m feeding freq and have been beaconing
there for a couple weeks now with no reports rcvd
other than my own and an added object for a ham
in TX that "connected" a couple days ago (need-
less to say, CONOK is now "OFF" :).

Is there anyone here doing anything on 10m w/APRS ?

(sorry for the long quote - I usually practice
a more militant editing action, but wanted to
make sure context remained, will chop the next :)

Hi Tyson -n- the group,

WOW!!! WAAAAY too many features to deal with :-/
I'm just looking for a simple GPS output for use
with APRS.. Don't need onboard memory for waypoints,
TrakBack, Logging, Mapping, Alarms, or tables...

Velocity (rate calc) would be nice, but not a must.
Altitude would also be nice, but also not a need...

As for the GPS unit (prefer bare board), the only
requirements I can think of at the moment are Low
Power consumption (don't want doggy's back to bow
from the weight of batteries :), external antenna
connection so a higher efficiency array can be used
to assure capture in wooded and shadowed areas, RS-
232 (NMEA) output compatable (preferably directly)
with TNC/Encoder, DGPS accuracy (no more than 30 ft,
prefer 10-15 ft) and reasonable 'warm' update speed
(10-15 secs would be nice)...

I'm looking into the Ramsey FT-146 for the RF, and
plan to research the TinyTrakII a little further.

Haven't looked up the Alinco xcvr yet, but I'm
willing to wager it's a bit more than the budget
will allow for this project :(Sounds NEW!
And the Rino is WAAAAY to much $$$$$$$$$$$!

Thanks for the input... More ! Please ???

FCC rules for FRS explicitly disallow data (except for the Garmin Rhino).
MURS allows data, but I don't know any lightweight rigs for that band.

As for GPS and TNC, a TinyTrak II will work perfectly. I'd suggest
integrating it in a Delorme Tripmate GPS - there are instructions on the
net for doing that and it reduces the number of separate components needed.

Hi,

Here is the link for one of the Alinco small radios. I could not find a picture of the credit card size ones,it is a discontinued product and very cheap ($40-$50) but I think the model number is DJ-C2 or something like that. http://www.alinco.com/Products/DJ-S11T.shtml The DJ-S11T is around $150 Brand new and I have seen them go for as little as $50.00 on Ebay. Keep looking there for deals, they do come once in a while. Also if you are looking for cheap and reliable then go for the TinyTrak. There is a TT version 3 coming out this month, so wait until then before you buy anything. The Pharos gps is very small and easy to mount how ever you like. It is a dummy head antenna and engine, no display. It is not much larger than a U.S. Quarter (.25 cents)http://www.gps4fun.com/ph_igps.html There is another GPS like that one which is newer and better, about the same size and cost but better performance. But I can not remember the model number right now.

Thanks for the thoughts and ideas, Phil...
No problem on NOT using FRS, don't need Riley
at my door unless it's for a friendly visit,
and a cup or two of coffee :) And maybe a chat
about the AM bootleggers on the low end of 10m!
(a bit miffed by the carrier beat from 28.185!)

Been running APRS on 28.187 LSB for a couple weeks
now with only one contact - a connect from a station
in TX... Needless to say, CONOK is now OFF :-/

The regs say that ANYone can apply for acceptance
on hardware used on MURS, so maybe it's time for
SOMEone to come up with a very small transmitter
only, or transceiver board for integration usage.
Don't know how much the process fees are, but maybe
it's not TOTALLY out of reach, if enough stamps can
be saved in acquiring the hardware components.

The TinyTrak II looks promising, and I'm researching
the posibility of using a Rand/Mac board for the GPS
receiver. Will check into the DeLorme as well.
Do you have any idea as to cost ?

Thanks -n- 73,
Bruce

Wait alittle while.. Byon is working on the Tiny Trak III. More abilities from what I have seen. The Tripmate has been outa stock for over a year or 2 from Delorme.. However, I havn't checked lately they may have come across a few. I wought 3 last time and the had a invetory of about 50 or less from what I was told. You maybe able to find them on Ebay and such. Or even find the Tripmate integrated with a TinyTrak.

Motorola has a Oncore GPS (reciever only) that works great. I have used a few of these in building TinyTrakers. The Oncores can be found for about $50 or less but that is about average from the ones I have seen and have bought. It is a board with the reciever only. There is no display or anything like that.

This is a variation of what was previously suggested:
http://home.wi.rr.com/n9uur/mim.html

GPS+TNC all inside the water-resistant GPS box of a Tripmate. external batteries to power both the GPS and the radio.

Tho, I really do like the idea of using the Garmin Rhino, there's nothing in there for digipeating, etc.

For what it's worth, this isn't only applicable to a dog. If something like this could fit in a nice discreet box, it could definately live on the rear deck of a car as a standalone tracker. Maybe a simple black wire 1/2 wave dipole along the inside of the back window... and your car is pretty reliably tracked, and very discreetly. Something I've been considering for a while... along with the original poster's idea about being able to just grab the radio for use as a radio if necessary.

Steven,
Most all the APRS software can be found at http://www.tapr.org also the founder of APRS Bob Bruninga- WB4APR has some great information for beginners at http://web.usna.navy.mil/~bruninga/aprs.html. Hope some of this helps..

479. Re: [APRS] Garmin GPS-III Plus HELP

Yahoo group: APRS (1998 — 2006)
Date: 2003-01-16 16:26:16 UTC
From: Jake
Topic: 474 Message: 479

I think any NMEA GPS will interface just fine with the radios. NMEA is the protocol used to interface devices together so they can communicate. So that should mean the Garmin III-Plus should work just fine. I currently use the Garmin 48 and it works perfectly too. Even plots the APRS beacons as waypoints on the map. Kinda nice.

Jake

Steven,

First thing you need in order to get started in APRS is a HAM radio license. Next, you need to have a radio and TNC.

Also, I can offer a lot more information if I knew what you wanted to do with it. For me, it is communication while hiking or traveling. I use the Kenwood TH-D7, it has everything (except a built in GPS) that I need in a nice compact package. There's a lot more I need to learn too :-)

Hello all. I am just getting into APRS. I am wondering if it is possible to use the Siglink sound card interface to link my IC-746 to my PC. For software I am using WINAPRS and the AGWPE packet engine. Am I even headed in the right direction?

Thanks
Jeff Standifer

Hi Jake,

This might be debatable :)
I know HERE we are dealing with pretty much JUST AmRad,
but (and please excuse me for bringing up another service)
from what I've seen of the MURS regs - wouldn't it be per-
missable to use a TNC (or TinyTrak like encoder) with a
GPS rcvr and a MURS transceiver with APRS ? As long as
it's for 'hobby' use and NOT commercial ??? Does Bob
register that type of use of his software ?

I'm hoping to set up a K9 Tracker in the near future,
and although I do have the license to op on the Ham
bands, it would be nice to be able to swap out the
xcvr on the packs from the Amateur Band (300mw DJ-C1)
to a MURS HT for the added 1700mw output and a little
more privacy 'anonymity' (at least in non-metro areas :),
or when I want to be sure and not add to congestion on 2m,
like when testing prototype hardware/firmware.

(or when using non-licensed ops during SATERN activities)

A small 'clip-on' piggy-back type GPS rcvr and encoder
would be a nice unit to to be able to add to Any HT...
(for those of us that can't afford the 'All-In-One' units)

You don't need a ham radio license to monitor APRS, You can use APRS software to monitor and also an Internet connection to "send" citizens weather data.

True, you never need a license to monitor any frequency (like the use of a scanner to listen to police calls).

Not so sure about being legal to send weather data via Internet. I would assume that same information also goes out over the radio waves too, and in that case, aren't use supposed to legaly have a license to do so on tha Amateur frequencies?

And also true, I totally forgot that you don't need a TNC at all, you can simply use the radio and sound board. But if you've got the money, I highly suggest the Kenwood TH-D7, or the D700, and I really wish I had the money for the TS-B2000 so I can do APRS on both 2m and HF while being mobile :)

fun stuff !

There is a "citizen weather" network that you can join
and send weather info thru the net to findu.com you
don't need to be a ham for this service. But it seems
awfuly boring. Another thing I have seen is the use of
APRS with CB radios. I don't think it's legal, but a
search on Yahoo shows that it is very very popular
nation wide.

From: Jamie R. Dean - W4JRD
Topic: 475 Message: 486

With WinAPRS unless the software is registered, when you send TCP/IP (internet) the information you send only goes to other TCP/IP users.

487. Re: [APRS] New to ARRS

Yahoo group: APRS (1998 — 2006)
Date: 2003-01-17 06:29:38 UTC
From: Jamie R. Dean - W4JRD
Topic: 475 Message: 487

A few years back there was a discussion about using packet on CB radio on the Packet BBS system. After some research it seem there is no rule againist digital use on CB as long as you remain under 4 watts on AM and 12 watts on SSB. Right now the common belief is that channel 38 (27.385) LSB has been made a sorta unoffical packet freq on CB.

Nope. The person running the radio is responsible for what that particular
radio transmits.

Depending on how much you want to use the GPS away from the APRS rig, the Garmins listed are good choices. If your intent is to leave it attached to the APRS all the time (say, in an RV), then you might investigate the Garmin GPS35PC - it looks like a mouse with a magnetic bottom. It's designed to be attached to your computer ONLY.

Also, RadioShack is now selling a relatively expensive computer-only GPS that you might want to take a look at.

I love my Garmin eMap. It works very well with APRS as a tracker and has alot of good features when you need a stand alone GPS.. I've been seeing prices on the net for around $200.

501. Upgrading APRS+SA

Yahoo group: APRS (1998 — 2006)
Date: 2003-01-28 05:27:53 UTC
From: kbrackins <kbrackins@interoz.com>
Topic: 501 Message: 501

Hi all, I just downloaded the upgrade to go from v2.15 to v.2.20.

I've copied the files to the aprs folder but there's evedently more required. Could someone please point me to some documentation on how to perform the upgrade!

Tks, de K4PCB

502. Tracking Software?

From: Peter <ve9ptr@hotmail.com>
Topic: 502 Message: 502

Hello,
I'm looking for some software that will track a APRS station and record the possitions it receives, preferably on a map, so you can see where it's been. Not just where it's at as most tracking software does. I hope this makes sense.

Regards,
Peter

Topic: 502 Message: 503

Peter,

WinAPRS can do this. If you will click on the station that you want to track then go to Display and select Auto Scroll Moving Maps, no only will it track that one station you can also replay the stations tracks on the maps.

I hope this helps,
Jamie R. Dean - W4JRD

Topic: 502 Message: 504

I have liked http://www.aprspoint.com and http://www.uiview.com. Haven't played too much with the full potential of tracking though. With APRSPoint, and with tracking for a station enabled, it seems that the only thing it does is not delete the previous positions from the map. So what you'll see is multiple positions with the old positions labeled with "old". I also haven't found a way to remove the tracked positions once I have them on the map (unless I want to remove all the positions from all stations). You can demo either version for your own trials.

Also, have you looked at http://www.findu.com ?
Also, http://www.wulfden.org/APRSTracking.shtml

Here's my location:

APRS+SA will do all of that and more. It will draw a
line on the map inbetween all the position reports and
keep them there untill you choose to delete them.

The Findu CGI can do some of that also. You can set up
some geo files or use even use the radar maps.
The CGI page has a lot of examples.

From: Tyson S.
Topic: 507 Message: 510

If you are using APRS+SA then you need to upgrade to
the newest version. The map website made some security
changes and outside connections that are attempted
will end in failure. If you are using the newest
version and you still get an error message then they
may have had more changes again.

511. Dead Reckoning

Yahoo group: APRS (1998 — 2006)
Date: 2003-01-31 06:14:42 UTC
From: Barry_bogart
Topic: 511 Message: 511

Which programs will do dead reckong to show the future location of an object? It would be a projection based on the course and speed at the last seen report. This would be useful for tracking objects which can't carry trackers (ie racers) but you still want to get an estimate of their location before they are spotted next. I know that DOSAprs does it but I don't think anything else does.

Hi all -
I just picked up a used older KPC3. When I hook it up to the computer the TNC displays weird characters like the baud rate/ word lenght is not set correctly. No matter what settings I try, I can't get the characters to decode properly. I'd like to do a hard reset to see if that corrects the trouble --- any idea of how I do this?

any other suggestions?

Thanks,
Ralph, KA8ZGM

From: Mike Byorick
Topic: 513 Message: 514

Ralph,

In order to perform a hard reset open the unit and locate the Hard Reset Jumper (J7). It should be labeled and will be on the back side of the unit about an inch from the Power connector. Put the jumper across both pins, then apply power to the KPC-3. You should get a message like this.

CHECKSUM OK
RAM OK xxxK BYTES
CLOCK NOT PRESENT
REPLACE TEST JUMPER

Remove power from the unit and return J7 to the normal position (one pin only).

put everything back together and power it up again.

Try 1200,n,8,1 and when you power it up, start typing the asterisk character.

By far the best APRS software is UI-VIEW32.
It has many add-ons like UI-ROUTE which will draw the track on the map as the station moves. You can even have it draw the track from logs as well as realtime.
Free download at this link:
http://www.apritch.myby.co.uk/uiview.htm
There is a Yahoo group for UI-View32 as well.

But that is only one opinion though! Hehehehehe....

I use APRSPoint which uses MapPoint from Microsoft that gives me very
detailed maps.. Where as with UI-View I have to create my own and such..
Time consuming...
WinAPRS is the other that I use since it already has DLG maps created
for my areas that are VERY detailed since they come from USGS.

Bob Bruinga just figured out how to display APRS data on a standard Caller ID box. As it turns out the Caller ID boxes use the same 1200 baud tones as packet radio! These units are cheap and usually have a 50 message memory. Check back here for updates about this project.

The low cost Ham Aid Box

Repeater owners and trustees might want to take note of a very intriguing article by Bob Bruninga, WB4APR that appears in the Fall 1999 issue of Amateur Television Quarterly magazine. Its called the Ham Aid Box and Bruninga says that it's a way to distribute text messages using an off the shelf piece of consumer electronic gear.

According to WB4APR, the caller ID units that many of us have in our homes use the same 1200 baud ASCII and Bell 202 standards as used on packet radio. He goes on to say that a caller ID unit hooked to the speaker of a mobile or base ham radio station can display up to four lines of text messaging. Since all caller ID units have memories, multiple messages can be stored.

The text message would have been generated by any ASCII capable TNC connected to the repeater. Bruninga says that this could make it possible to implement a universal and low cost amateur radio text distribution system, almost overnight.

I looked into these awhile back.. The draw back is keeping the line open on the CallerID box for it to watch for information... I talked with bob several years ago about this and basically it comes down to the box listening for a RING and then opening the port to collect the data.. I tried several attempts but failed at this... Dropped the idea till someone else could come up with a fix. From what I have seen they open the port for a short to collect data since most of these units are powered via batteries and try to keep that stuff short to save on batteries.. Kinda like a Low Power mode on a radio where every 5 secs it opens the reciever to listen and the closes the rec. if no signals are present...

Too bad. And I don't suppose any of these have an identifiable PIC chip
you could pop out & replace with one you programmed. Probably any possible
application of these would have to use them as-is. "Ring" shouldn't be too
hard to simulate. Although it's supposed to be about 90 volts @ 20Hz, I
think many devices will operate at less. I don't subscribe to caller ID,
so I'm going by memory from my mother's. Seems like the LCD display is
always on, and the buttons let her scroll through messages.
Also, in my application, I would want to display info other than raw packet
data, which is what I think you'd see by "opening" the port and displaying
modem-able data. Right?
My thought is that a Caller ID is probably a really cheap alpha LCD display
and incoming-modem. I would expect to receive packets, filter and reformat
the data I want, and send that to the display. Since I'm doing all that,
I should also be able to bleep out a Ring signal.
I'll probably find that the trouble outweighs the cost of a stock alpha LCD
display.

I am one of Byon's beta testers and we're working on getting the
PICPAC out soon. It's probaly going to be a semi open source project.
I have a yahoo group at http://groups.yahoo.com/group/picpac feel
free to join and get ready to get in on the fun.

Don,
For an at home 1200bps APRS station the 1270 will do anything you need it to. Only thing I see any trouble with is you can't run it as a mobile APRS tracker...
I hope you have fun on APRS. I've been running it since 1994 and really enjoy it. Right now I run the W4JRD-4 VHF<->Internet Gateway (IGATE) here in western NC.

Don't worry about running that huge TNC as a tracker, keep it at home where you have space. Get a TinyTrak http://www.byonics.com . This is just what you need for a mobile tracker. Small, Simple and it works. Check out mine at my page http://www.ke4nyv.com also check out the HamHUD II at http://www.hamhud.net I also have one of these on my site that I built. And there is the up-comming PICPAC from byonics.com I have been lucky enough to be a beta tester so I have pictures of my beta unit on my site as well. The nice thing is you won't need an external TNC to make it work, it's built in.

Hope that geives you some ideas.

532. cheapest GPS ?

Yahoo group: APRS (1998 — 2006)
Date: 2003-02-14 04:47:47 UTC
From: Don Pomplun
Topic: 532 Message: 532

What's the bottom end GPS with display & (hopefully NMEA) serial output these days? I checked around at the Garmin ETREX that seems to be about $100. Is this it? I'd like to put together a tracker (is that the right term? I'm new at this APRS stuff), but would find a speed display beneficial. However, don't need waypoints and all that stuff. My guess is you can't avoid all the frills, since it's "only software".

Not exactly APRS, but somebody probably knows ---
When I set a bunch of waypoints in my Garmin 3+, they didn't seem to be where they should have been when I pressed the MARK button. After doing each, I entered a name before pressing DONE. Is your position when you press MARK what goes in, or is it the position you're at when you press DONE? The book implies the former. TIA

I used a yellow Etrex as the input to my Kenwood D700 for years, and it worked like a charm. Of course I read the speed display off the radio, and not off the GPS.

I now run a Delorme Tripmate as my GPS (no display) for my tracker, and keep the Etrex on the dash for those times when you want to have the display.

The combo works great, and you don't require all the wires.

The tripmate can be found on Ebay for about $60 US. It does require some internal modifications to work as a tracker though.

539. Insurance Discount?

Yahoo group: APRS (1998 — 2006)
Date: 2003-02-19 15:30:18 UTC
From: Adam Berson
Topic: 539 Message: 539

I was considering building a hidden APRS tracker out of a delorme tripmate, the tinytrak or whichever one it is that fits inside the tripmate, an old HT, and maybe a hidden antenna. I think it would be a fun project, and cool to have. Also, it would be great to have a spare, charged HT always in the car if I need it.

My question is this: Has anyone succesfully gotten an insurance discount from this? I know that there are documented cases of APRS recovering stolen vehicles (newsline #1000 & #1163), so I think I could make a case for it. What I'd need to try to determine to present to the insurance company (if they even ask... "what location service? APRS? ok.") is what kind of coverage APRS Wides/i-gates can provide for a 5W HT w/ a marginal (hidden) antenna. Is there a way on findu or elsewhere to bring up a map of igates only? In live in NJ suburbs of philadelphia. Also, it would be good to compare this to lo-jack...Does anyone know the "range" a police cruiser needs to be in for lojack?

This would be in the spirit of amateur radio, but would be providing monetary savings. Does anything feel that this would be illegal because of the money? I'm not receiving money for my services, so I think it would be legit (on the order of using autopatch to order a pizza, the common legal example).

Thanks
-Adam

Take a look at Xastir, http://www.xastir.org or
http://xastir.sourceforge.net

It's in active development and bug reports or feature requests are
often fixed or honored within days.

It can read WinAPRS/MacAPRS/aprsDOS maps as well as Geotiff, ESRI
Shapefile, and any raster format that the ImageMagick package can
read, which comes to well over 100 map formats.

I think it doesn't matter which distro you use. I run RH 8.0. Just compile the kernel with ax.25, install the libax25, ax25-tools and ax25-apps. There is a good ax.25 howto also.

I didn't manage to run it on a Sun UltraSparc 1, the 'Amateur Radio Support' wasn't in the kernel make menu?!? I also have not tried bsd yet.

You can get lots of information about what systems it runs with
(nearly all) and any quirks of particular distributions at:
http://www.eskimo.com/~archer/xastir.html

You don't have to install the AX.25 stuff, Xastir can use a TNC in its
normal convers mode, or Xastir can connect directly with a TNC in KISS
mode.

Topic: 548 Message: 548

I am getting frustrated trying to interface my KAM All Mode with
APRS. I
have no problems gettin the RX portion to work. The trouble im
having is getting the VHF to transmit.

Has anyone gone through this?

Dennis:

What program are you using ?? It's obvious that you have the hardware aspect worked out - it's the software that needs work. Now, I'm sitting here in my sick bed trying to remember, but in WinAPRS, you have to configure radio buttons IN SEQUENCE to get the right commands to come up and filled in the boxes - something like KAM and dual-port. I, personally, like UI-View - quite a bit more intuitive and interfaces fine with mapping packages. I went ahead and bought Precision Mapping - Traveler to get good zoomable maps.

Topic: 550 Message: 550

I did finally get the TX to work. There is a sequence that has to be followed. I ended up with the following:

Select TNC type:
Single TNC on VHF

TNC:
Single port default.

Even though Im using a KAM ALL Mode Dual TNC running Ver 8.0 software, I had to setup APRS with single TNC settings. I am not using the HF port at this time..
I have played with 100's of different combinations of setup parameters.

Are you looking to just transmit your position? If so, you'll need a GPS
that can send out NMEA strings (Garmin eTrex or the like -- RatShack also
has this interesting-looking puck unit), along with something like a Tiny
Trak ( http://www.byonics.com ). Also, a better antenna - at least a
mag-mount 1/4-wave whip.

If you want to receive, you'll need a more traditional TNC plus a computer
and software.

If you want to transmit and recieve APRS on a HT, the Kenwood TH-D&A
may be the way to go. You can send messages with this unit too.
Read the downloadable brochure at Kenwood's site. At Hamshopper.com
the low price is $419. I recently purchased 1 last month at the
Orlando Hamfest with a coupon price of $339 out the door.

I also purchased a GPS Deluo□ GPS for PC/Laptop (Serial-RS-232) for
89.99 including shipping. www.deluo.com (6v-14v, I think) It has no
display, but most of the position data is available on the radio's
display. This unit has a serial interface. It's easy to built an
adapter cable into the radio with the extra jack provided from
Kenwood.

You will need a seperate power supply for the Deluo GPS, attached as
a dongle from the serial connector is a mini din plug, same as
keyboard or mouse. I have a 4AA batter box with on/off switch from
Rshack, it has been modified to adapt the female socket side of a
mouse extension cord to it to provide 6v power to the GPS unit.

When mobile (for local use) I use a mag mount 1/4 wave magnetic
mount antenna w/sma connector.

What level of APRS do you mean? If you want GPS in addition to APRS then the expense rises quite a bit. If you want APRS on 2 meters without GPS you can do it cheap, possibly free. You can get a free copy of APRS software, perhaps UI-View , you can get the shareware soundcard packet software and interface it with UI-View, I have done this and it works fine. You would have to have a computer as part of this set up. That makes it mostly a fixed station unless you use a laptop.

You can add a real TNC that would not depend on a soundcard for the APRS. Perhaps a PIC based product such as the one from http://www.john.hansen.net/PICTNC.htm or get a used TNC like a PK88 or even a PK232. I am not sure what they go for but I am guessing you could get a PK88 for $40 or less.

You would also need to build a circuit to key the PTT of your handheld but that can be done for under $10.

It connects in place of the PC, on the TNC's serial port.

I think the earlier PK232's do not have the support for APRS beacons but the later ones do.

The only exceptions to this rule are the KPC-3 Plus and the PacComm PicoPacket (GPS model) which have second serial ports for the GPS data input.

Well if the PK232 is like my PK-900 there is no separate connection for a GPS to the TNC. I can only think that you would need a computer with 2 serial ports. Now I'm the first to admit that I may not know all the in's and outs.

There is a multiport adapter on www.pocketaprs.com But it was for the DF JR. I have taken that and made the phone jack plug a 9 pin serial port. The problem with it is the data sometimes ends up crashing into each other for a second or two. I am currently playing around with it for feeding my Doppler, GPS, and TNC all into the serial port on my visor and also my HPC. Tests so far are good with little data collision.
Will let everyone know how the rest of my tests turn out.

Date: 2003-03-02 21:34:25 UTC
From: Luis Rolo <luisrolo@iol.pt>
Topic: 560 Message: 560

hello all,

I've been trying to set up an APRS receive-only station with Icom PCR-1000 scanner and my PC soundcard and i am having problems in the AGWPE and UiView configuration. I followed all the "help hints" of both software with no result. As Ui-View only works with agwpe well configurated, i think the problem is on AWGPE.
Any opinion? All of them are welcome.
thank you.

My project is going to be outside, mounted on the roof of may car, held of course with magnets, a cookie tin would work, will have to take my board to wal-mart and do some measuring!
Other than that any information would be helpful, the height doesn't have to be more than an inch tall or so for the project.
Thanks

Go with the D700. It has proven itself in the field. the alinco from what I have heard (RUMOR) you have to buy an additional board to plug into the radio. And with that I am not 100% it will run APRS by itself. But like I said the Alinco is RUMOR.

Some of the benifits of the d700 is its remote ability and remotes well with the D7a. That and it comes with everything you need minus the GPS to get APRS running and includes messaging. It even comes with the cable to go from the GPS port on the radio to wire into a cable that plugs into your GPS. IE you supply the GPS data cable and Kenwood supplies the cable to wire into your data cable of the GPS

ONE Minus on the D700.. You cannot install the head from the top of anything. It has to be a verticle plane or horizontal plane below your view. IE you can't hang the head from the top of the cab of a truck. If you wish this you have to pray for a miracle that kenwood can adapt to or you have to have a special bracket made for the head...
Only beef I had with the D700

566. Thanks for all the information! (Was round enclosure question)

Yahoo group: APRS (1998 — 2006)
Date: 2003-03-05 03:09:29 UTC
From: Peter "Dakota" Summerhawk
Topic: 566 Message: 566

I have been shopping and have found that a PVC end cap does fit my board. The reason I asked and I am sorry to have not mentioned it in my first email is I have a Doppler array with eight antennas attached to it is that the PCB board was enclosed in a thin layer of sealant and over time it wore away. The components got wet and I had to rebuild it. I was searching for a way to seal the unit from the weather (antennas and all) and still mount it to the car via the magnets. The end cap I found is round on the top and I have a flat section that I am going to cut and place on the bottom of the unit and seal it to be able to have it sit on top of the car full time. It may look a little strange but then so do the rest of the antennas on the roof, the wife wants me to paint it another color other than white (the car is gray) but that has yet to be decided!
Thanks for all the information that has been provided in my search for a "better mousetrap!"

From: kbrackins
Topic: 567 Message: 567

Could someone please expand this concept? Is it the conception that when a packet is sent out from say your 700; when a relay station gets it, an asterisk is added to the statement so it now looks like this, relay*,wide,wide. Then when a wide station gets the packet an asterisk is added after the 1st wide statement, now showing: relay*,wide*,wide. When a second wide station receives the packet, the 2nd wide statement would then be asterisked and the packet would no longer be repeated??

So theoretically if you wanted a station to go through 3 relays before it reached a wide station you could enter relay,relay,relay,wide,wide??

Thanks and 73 de K4PCB

Kevin, I will give it a try.

First let me explain wide. A wide is a Node. These are your Digi stations. (or you could call it a repeater station) Now what I normaly do is tell people that setup a basic aprs station at there house is to set there tnc alias to Relay. What this does is helps any mobile staitons that are driving aroung that cant quite get to the node. When you transmit your packet it will go to the realy station first. That station then will transmit the data to a wide (Node). by having another ,wide that will have the wide transmit your data one more time and there should be a gate near by to pickup your data and send it out over the internet backbone. Never put a relay after a wide. I would recommend only using RELAY,WIDE,WIDE depending on the nodes in your area that is usually all you need. A good check is beacon your data and check the internet with findu.com to check for your data. If you still not making it try one more wide at the end. Don't get carried away and put too many. Hope this helps.

571. Political Messages in APRS

Yahoo group: APRS (1998 — 2006)
Date: 2003-03-09 22:48:26 UTC
From: stringfellowww
Topic: 571 Message: 571

I Came across a disturbing Message in APRS Today from an Italian station, He's placed an Object in Iraq that reads "WAR? NOT IN MY NAME!" and Called the Object "Peace !!" His Callsign is "IK4OLP"

It's my opinion that APRS Should NEVER Contain Political Messages like that, and what this guy is doing is WRONG!

Whether you are for it, or against it, doesn't matter. Keep the Political Messages to yourself, and Out of the Hobby.

These opinions are mine, and mine alone.

573. Newbie to Aprs and TNC

Yahoo group: APRS (1998 — 2006)
Date: 2003-03-10 05:40:32 UTC
From: tafische
Topic: 573 Message: 573

I am pretty new to APRS and TNCs. I really want to start playing with APRS and am thinking about getting a TinyTrak3, but I am interested in what I can do with a TNCs.

What can I do with a full TNC that I can't do with a TinyTrak? I really don't want to spend a bunch of money on a full TNC unless I really need it.

Thanks! Terry KD4ZOY....

574. Re: [APRS] Newbie to Aprs and TNC

The Tiny Trak is a TRANSMIT only tnc and cannot
recieve or decode or display anything at all. A full
tnc will allow for bi-directional communications and
allow you to use APRS software on a computer. I would
suggest getting both because you can use a very OLD
and outdated tnc from eBay or something since the
software does all the work. Use the tiny trak in the
car for a tracker and some old $30 TNC for the
computer at home.

If I use a TNC I also have to have a computer attached right?? Or does the GPS connect directly to the TNC?

That would keep me from hooking up the GPS as my laptop only has 1 serial port. I have seen dual port TNCs, but they seem rather pricy...

Tyson,

I have a PK-232mbx w/DSP daughter board (installed the board two years ago and haven't tried the TNC since...I hope it works !!). Do you think this would work, and if so, which software do you recommend (I, too, am a newbie and expect my Knwd. TH-D7A(G) any day now)?

Ok, so a mobile should probably use RELAY,WIDE or RELAY,WIDE,WIDE

what about TCPIP?
Would it be appropriate to put RELAY,WIDE,TCPIP?

The last bit of this page:
> http://web.usna.navy.mil/~bruninga/APRS-docs/DIGIS.TXT

mentions that if the digipeater is smart and knows the path to the last
place listed (HOME) then it will forward it via the known path... maybe
I'm misreading it, but would that work to do with TCPIP if you're
looking to get your packet reliably to an igate?

Well this setup would require a more expensive TNC, if
you want a tracker then a Tiny Trak will do good for
the car, and an older TNC will do fine for a home
setup only, if you want a tnc and computer in the car
with a gps attached, then you must go with a newer tnc
such as the "KPC-3 Plus" with the GPS data port built
in, these are $169.00 at hamradio.com

It's not better, actually. The "relay, wide, wide..." form was the original method. "relay, wide3-3" form came later and is the preferred usage.

The point I was trying to making was that "relay" should only appear in the first position, if at all.

I am not sure about the PK-232, but if it's a regular
tnc it should work just fine with the software.
Probably might not work as a tracker. I also have the
D7A and would not give it up for the world. Nothing
better for APRS.
One thing you will want to do though is run the D7A
with the battery power save function turned OFF
otherwise you will miss packets all day long. You
battery will die constantly but there is nothing you
can do about it. If you are using it in the car than
you will want the filtered cigar lighter cord. If you
don't run filtered cord the alternator whine from your
car will corrupt some packets occasionaly.

PK232 works fine with APRS.. I run one with APRS just to listen with since it has a jack on the back and all I needed was a patch cord with 1/8inch jacks on each end.. after listening I then turned around and hooked up the TNC to the radio and was transmitting in no time.

I'm not sure if anybody has mentioned the software that uses your soundcard to emulate a TNC - no hardware to buy... AGW packet engine, for example. It's a little difficult to get setup at first, but is a cheap alternative for getting on the air and just seeing what aprs is all about, before you go plunk down money on a TNC. It does use your serial port to control PTT on your radio tho, so unless you have VOX or build a simple VOX adapter, you wouldn't be able to free the serial port up.

here is a great tutorial, including info on the PTT interface and setup for a few APRS programs:
http://www.qsl.net/soundcardpacket/

this is how I got started learning about APRS, and I still don't own a TNC (though, I just bought a tinytrak for the car).

583. APRS emergency uses

Yahoo group: APRS (1998 — 2006)
Date: 2003-03-11 20:07:41 UTC
From: Adam Berson
Topic: 583 Message: 583

Can somebody give a rundown on APRS emergency uses?

specifically, not uses for emergency events, but the ways that APRS can be used to get help in an emergency.

I know there is an "emergency" icon, but is that the only way? Either create yourself or an object with the emergency icon? Does that raise red flags, draw attention to itself on the displays of APRS users nationwide? Is there a way to send a CQ message such that it shows up as an emergency/priority/etc?

Thanks
-Adam

If I am not mistaken the wide3-3 and trace3-3 where u add a number to
wide or trace only works if u have a digi that uses a Kantronics KPC3
plus ver 8.2 or 8.3 thay are the only digis that use that feature I
use relay wide wide3-3 somebody please correct me if I am wrong.

I believe that all APRS PC software handles WIDEn-n correctly. The only TNC manufacturer I am unsure of is AES (but they've been out of business for a few years anyway). MFJ TNCs don't do it, but there are replacement ROMs available.

In addition to the PC software mentions already, I'll say that the KPC3 with 8.2 or 8.3 firmware DOES utilize the WIDEN-n feature, but I think it has a bug in it with relation to ID or NOID which renders a small part of the use of the WIDEN-n useless, though for nearly all other purposes, it handles it correctly.

In addition, there is some firmware replacement for TNC2 clones called UIDIGI, and this works very well with WIDEN-n. In addition there is a DOS and UNIX software package called DIGI-NED which is super-smart, in that it's software and so it's infinitely programmable to handle all kinds of special cases and local anomalies.

March 12th 2003

Hello Group:

I am just getting started in packet radio and I have an old MFJ 1278B DSP Multi mode controller that I would like to connect to my Yaesu VX5-R portable, while I am at my computer and in my QTH.

What I would like to know is: "What type of Software do I need to have in order to run this TNC?" then, what kinds of connectors would I need to have in order to connect a TNC like this to my Yaesu VX5-R?

Is there a Webpage out there somewhere that would list the various connectors nesecarry in order to connect different kinds of radios to the MFJ 1278B DSP Multi mode controller?

I have seen a few Years ago that there is a multipurpose type of jack or switch or cable splitter available through MFJ that would be able to configuredifferent types of radios to their modems, but I am not totally sure if their product would work with a Yaesu VX5-R portable.

Thank You Very Much! Take Care. Talk to You Later.

591. APRS Packet

Yahoo group: APRS (1998 — 2006)
Date: 2003-03-14 15:58:01 UTC
From: tafische
Topic: 591 Message: 591

I am new to APRS and just got on the air last night. I am trying to understand how to decode the raw packets that come into findu.

Mine is:

KD4ZOY>APT310,KD4TJN-3,WB4EPG-3*,WIDE3-3,qAS,WB4EPG:!
3503.93N/08947.34Wk000/000/A=000291

KD4ZOY> ME
APT310 ??
KD4TJN-3 ??
WB4EPG-3* ?? - what is the *
WIDE3-3 ?? - I am setup as relay,wide,wide3-3
qAS ??
WB4EPG:! ??
3503.93N Lat/Lon
08947.34
Wk000 ??
000 ??
A=000291 Altitude

Can someone fill in the blanks??

Thx! Terry KD4ZOY

Isn't this all outlined in a 'README' type text file
within the directory structure of APRS ? In the DOS
version of APRS that I normally use, IIRC it usually
ends up in the ./APRS/README directory.

Try the APRS specification at http://www.tapr.org/tapr/html/Faprswg.html
<http://www.tapr.org/tapr/html/Faprswg.html>

It is a large file but very informative. I used it to figure out the raw
packet info from findu.

594. Service on KPC 3+

Yahoo group: APRS (1998 — 2006)
Date: 2003-03-17 04:23:09 UTC
From: kevin_ka0i
Topic: 594 Message: 594

I have a KPC 3+ that I got as part of a package deal. It is not working properly. I have another one and have swapped the firmware chips. The firmware is ok. It lights up and appears to work, but I am not able to communicate with it. I've tried all the basics... hard reset etc. It has problems. Has anyone had any experience sending those back to Kantronics for service, or know a good place to send one for service?

Randall - Thanks for your reply. I had already tried leaving the battery disconnected for several hours. The good news is that the unit is working now. Thanks to Ken at Kantronics Technical Support. He suggested that I swap U1 (a 14C88 type IC) and give that a try. That fixed the problem.

?Rush Network? in no Rush to Build out 220 Network, Rush seeks to assign Lic
to the
Association of American Railroads.

PUBLIC NOTICE
Federal Communications Commission
445 12th St., S.W.
Washington, D.C. 20554
News Media Information 202 / 418-0500
Internet: http://www.fcc.gov
TTY: 1-888-835-5322
DA 03-798

March 17, 2003

WIRELESS TELECOMMUNICATIONS BUREAU SEEKS COMMENT ON AN
ASSIGNMENT OF AND A REQUEST FOR EXTENSION OF TIME TO CONSTRUCT
A 220 MHz NATIONWIDE COMMERCIAL LICENSE

Petitions/Comments Due: April 17, 2003
Oppositions Due: April 28, 2003
Replies Due: May 5, 2003

Pursuant to sections 1.3 and 1.925 of the Commission?s rules,1 the Wireless
Telecommunications
Bureau (?Bureau?) seeks comment on an application filed by Rush Network
Corp. (?Rush
Network?) and
the Association of American Railroads (?AAR?) to assign the 220-222 MHz
(?220 MHz?)
nationwide,
commercial Phase I license, call sign WPWY753 (?License?) from Rush Network
to AAR.2 The
Bureau
also seeks comment on a related request for extension of time to meet the
final
construction requirements
for the License.3

On March 3, 2003, Rush Network and AAR submitted an application to assign
the License from

Rush Network to AAR. Contingent upon the Commission?s consent to the
assignment, AAR
requests

that the Commission waive four of its rules to allow AAR to use the frequencies to develop a private, non-commercial system for the freight railroad industry to operate switching locomotives in railroad yards using radio control links.4 Specifically, AAR seeks a waiver of sections 90.713(a) and 90.717(b) of the Commission?s rules, both of which restrict the spectrum covered by the License to commercial use only.5 AAR also seeks waiver of section 90.715(a), which designates one frequency in each 220 MHz channel pair as the ?base station? frequency and the other as the ?mobile station? frequency.6 Finally,

1 47 C.F.R. ?? 1.3, 1.925.
2 ULS File No. 0001217770 (?Assignment Application?).
3 ULS File No. 0001217811 (?Extension Request?).
4 Exhibit A to the Assignment Application (?Waiver Request?) at 1, 4-7. According to AAR, this technology, known as ?Portable Locomotive Control Technology,? was approved for use in the U.S. by the Federal Railroad Administration in 2001. Id. at 4-6.
5 Waiver Request at 2. 47 C.F.R. ?? 90.713(a), 90.717(b).
6 Waiver Request at 2-3. 47 C.F.R. ? 90.715(a).

AAR asks the Commission to waive of section 90.709(c), which subjects an assignee of a Phase I nationwide 220 MHz license to the four construction benchmarks set forth in section 90.725 of the Commission?s rules.

7
At the same time as the assignment application, including AAR?s waiver request, was filed,

Rush Network also requested a waiver of the construction requirements of section 90.725. Rush Network asks the Commission for at least two additional years to meet the final benchmark for the License because of equipment unavailability to expand its current system and the potential

assignment with
AAR.8
Final action on the proposed assignment from Rush Network to AAR, AAR?s
waiver request,
and
Rush Network?s extension request will not be taken earlier than thirty-one
days following
the date of this
Public Notice.9 Interested parties may file comments or petitions to deny no
later than
April 17, 2003.

Persons and entities that file petitions to deny become parties to the
proceeding. They
may participate
fully in the proceeding, including seeking access to any confidential
information that may

(other than
United States
Postal Service Express Mail and Priority Mail) should be addressed for
delivery to 9300
East Hampton
Drive, Capitol Heights, MD 20743. All filings must be addressed to the
Commission?s
Secretary, Office
of the Secretary, Federal Communications Commission. See FCC Announces a New
Filing
Location for
7 Waiver Request at 3-4, 7-8. 47 C.F.R. ?? 90.709(c), 90.725(b). The final
benchmark
requires the holder of
a nationwide Phase I 220 MHz license to construct base stations and place
those base
stations in operation in all 70
geographic areas designated in the original application for the license,
including at
least 28 urban areas listed in
section 90.741 in the rules, within ten years of the original license
grant ? which, in
the case of the License, is July
29, 2003. 47 C.F.R. ?? 90.725(b)(4), 90.741. AAR requests that, in lieu of
the current
final construction
benchmark, it be subject to a ?substantial service? requirement.

8 Extension Request at 5.
9 See 47 U.S.C. ? 309(b).

599. GPS & Mobile Weather Station

Yahoo group: APRS (1998 — 2006)
Date: 2003-03-20 20:23:00 UTC
From: grandpa_phil
Topic: 599 Message: 599

Magellan has a GPS called the Meridian Platinum (appx $285 - $50 rebate) which contaings a mini weather station built in. It's capabilities are somewhat limited. However, I think this unit would be great for a mobile station.

There is one thing missing though:

1) the ability to ouput the data via the jack on the back (called Magellan to confirm today)

I suppose for automotive usage, remote sensor capabilities would be nice too.

Perhaps if people call Magellan and ask this question, it will get incorporated into the next version of the product.

Any thoughts on a device like this?

Ken
KC8SWY, Coloma/Big Rapids, Michigan

From: Peter "Dakota" Summerhawk
Topic: 599 Message: 600

According to the site just a Barometer is installed in the unit, no temp or anything else, not really handy for a weather unit. Some of the other hand held weather stations that I have seen have the ability to have a cable hooked to them and be able to have the data downloaded, I don't know if the data stream is just downloaded or it can be used for APRS. I will hunt down the link and send it to the group.

602. micro weather station

Yahoo group: APRS (1998 — 2006)
Date: 2003-03-21 06:34:32 UTC
From: Barry_bogart
Topic: 602 Message: 602

I asked before, but got no response. Is there any possibilty of hacking a Bruunton Sherpa to use as an ultraportable weather station? If you don't know what these are, see below, They are about half the width of an eTrex, and 1/4 the weight.

SHERPAT ATMOSPHERIC DATA CENTER
MSRP: $159
Features include:

a.. 3.9"x1.5"x7"
b.. 1.5 oz.
c.. Altimeter: 3ft/1m resolution up to 30,000ft/10,000m
d.. Barometer displays trends within past 16 hours
e.. Measures windspeed in knots, mph, beaufort, km/h and m/s
f.. Measures temperature in ?C and ?F
g.. Calculates windchill
h.. Calculates current, peak & average wind speed
i.. Clock
j.. Floats
k.. One 3v lithium CR2032 battery included
l.. 2 yr battery life
m.. Colors: blue and orange

603. Two TNCs and two paths with WinAPRS?

Yahoo group: APRS (1998 — 2006)
Date: 2003-03-21 21:04:22 UTC
From: n3eg7
Topic: 603 Message: 603

I have one VHF and one HF TNCs on WinAPRS, and can't figure out how (if it is possible even!) to get two different paths to work on start-up. They seem to both follow what I try to set on one. Any ideas?
I seem to be on the Sprouls' email filters these days, so thought I'd try here...

605. VX7 and TNCs

Yahoo group: APRS (1998 — 2006)
Date: 2003-04-01 23:52:22 UTC
From: Greg
Topic: 605 Message: 605

Anyone hooked up a tnc to the VX7 for APRS or SSTV? Any recommendations on a good portable tnc unit? Does anyone know if the tinytraker will work with the vx7? As you can tell I'm really new to this side of radio any help on getting started would be gladly recieved. I hit a bunch of links but I'm not sure what's good and what will work. On the side, I am also wondering how you could set up an internet gateway at home to link to while you're on the go.
Greg, KD7IBL

606. Pocket APRS and Wireless TCP/IP

Yahoo group: APRS (1998 — 2006)
Date: 2003-04-07 18:35:53 UTC
From: wcpd
Topic: 606 Message: 606

I have a Handspring Treo 300 with a wireless internet connection. I would like to run PocketAPRS on it with a TCP/IP connection to the internet. In WINAPRS there is an option to connect via a TCP/IP connection but I could not find an option for this in PocketAPRS. Has anyone tried this and been successful?

607. New setup

Yahoo group: APRS (1998 — 2006)
Date: 2003-04-07 22:07:41 UTC
From: John Schneider
Topic: 607 Message: 607

Good evening,

This past weekend I was able to get my new APRS setup on the air. I installed a Diamond X-200A and 70' of RG213 into a Kenwood TM-D700A.

I have been trying to get WinAprs to read the data from my com port (1) which is where the Kenwood is plugged in.

My problem is that I can't get WinAprs to plot any of the received signals on the supplied maps.

I am, obviously, brand new to this aspect of the hobby and would appreciate any help you might be able to offer.

Note: I am located on the north shore of Long Island and, from what I've read, APRS can be somewhat area specific. If you have monitored any of my beacon activity and you think I am doing something wrong PLEASE let me know.

Thanks for the bandwidth...

John, KB2COP

608. Multiple GPS Feeds?

Yahoo group: APRS (1998 — 2006)
Date: 2003-04-07 23:20:34 UTC
From: Bill Reid- VE3VWD
Topic: 607 Message: 608

Hello All

My mobile setup is a Kantronics KPC3+ v8.3 with a Palm IIIxe and a Garmin Legend GPS.

What I would like to do for my holidays is to feed the GPS NMEA output signal to both the TNC and my serial port on my laptop running Streets & Trips 2003 so I can monitor my exact location and follow route plans.

Is this possible , the parallel feeding of the ground and GPS TX data ?

I will not be sending data to the GPS as the TNC does not support it.

Would the loading have an effect on operation of the GPS,TNC or Laptop?

Has anyone tried it?

I have UIview and I can create maps for it , but I find that I prefer the zoom, and routing capabilities of S&T 2003.

I would also like to create some maps for PocketAPRS. Is there any good sites out there with good descriptions?

73 & TIA

I made one of these 'Y' cables today and it appears to work ok.

My cable was to send the output of my Magellan MAP330 to my Toshiba laptop
and a TinyTrak3.

I connected the GPS tx and rx data lines to the laptop but only connected
the GPS tx data line to the TT3. And of course, all 3 ground leads are tied
together.

I did look at the GPS tx data line with a scope and didn't see any loading
of the data when the laptop and TT3 were connected.

Don't feel too bad, on more than one occasion I forgot to put the negative sign needed by my program to tell it that I was in the western hemisphere. I was finding myself in the middle of Mongolia!

If you have a map progam like Street Atlas, or just a GPS, Use them to find your lat and long. Bear in mind that you're probrobably going to have to deal with decimal degrees. with some programs or the map program will tell you the lat and long using decimal degrees. So be aware of it and prepared to convert it if need be.

Warren,

Well, as it happens, I have been preparing for the arrival of the new radios (the 'A700 and a TH-D7A(G)) for about a week and a half. I purchased a Palm IIIxe and I bid on and won a Rand MacNally GPS Navman GPS and Street Finder package.

I really haven't been able to find too much information regarding the Palm/Navman GPS combination on the web, but I am still looking. I think the biggest problem with the Palm set-up is going to be the cable from the palm to the TH-D7A, but again, I haven't spent a lot of time researching this.

My Lat. & Long. coordinates are not off by much at all...actually just about one hundred yards, and your idea of using my own GPS to find a more exact position was, not surprisingly, one I never considered (I'm lucky to be able to find my way home after work !!).

The problem you have with using a palm GPS is the fact that the GPS takes the only communication port on the Palm. When the GPS is connected, there is no way for the palm to communicate with an outside device.

I really liked my palm GPS. For $50 is really a versatile unit. There are so many programs out there to use. It is just not very rugged, and I almost trashed my palm Geocaching. I then purchased a Garmin Vista and really never went back to the palm.

A really neat thing you can do with the Palm GPS is take it apart and pull the GPS board out of it. You can hook a power source to it and it works with 2 wire serial (tx and gnd). You now have a little dedicated GPS. Pretty cool!

Thx, Terry

Funny you should mention that...I just sent a message to Blue Hills Innovations www.bluehillsinovations.com asking them if they produce a cable to solve that very problem! I would certainly like to eliminate all other possibilities before I crack open my new GPS and turn it into a nice collection of useless parts.

Not being familiar with that model of Palm I can't help much there but I've had a Sony Clie which runs on the palm OS. I've messed with a few mapping programs but not been impressed by the imports into the Palm unit in general. You're limited by the memory in the unit. So you end up with a very narrow "window" to your route. I've only tried a couple of downloading maps to my unit to have quick access to the map route. I've not tired to attach a GPS to it Although there are a few gps models out there for Palm units that plug into the memory slot on the palm.

From what I've been able to find online about palms and APRS. you should be able to use the hotsync cable. And I think you can buy a cable connection that is not the charging cradle.

I was finding information about a Beta version of a PalmAPRS program which was where I found the previous information

Good luck

Let us know what you find out. I would be very interested if there is a solution. I am not quite sure how you would do it the way the gps connects to the palm. I am sure there is some really smart guy out there that could figure it out!

One thing that might work is to open the GPS and connect 2 wires to the output of the GPS to go to your radio. You could actually add a little connector to the side of the gps and plug in your radio when you needed it.

I don't know how this would affect the overall GPS communications, but it is worth a try. I have heard of people splitting the output of a GPS signal without any problem. That would be an interesting experiment.

Funny you should mention that...I just sent a message to Blue Hills Innovations www.bluehillsinovations.com asking them if they produce a cable to solve that very problem! I would certainly like to eliminate all other possibilities before I crack open my new GPS and turn it into a nice collection of useless parts.

Subject: RE: [APRS] New setup

The problem you have with using a palm GPS is the fact that the GPS takes the only communication port on the Palm. When the GPS is connected, there is no way for the palm to communicate with an outside device.

I really liked my palm GPS. For $50 is really a versatile unit. There are
so many programs out there to use. It is just not very rugged, and I almost
trashed my palm Geocaching. I then purchased a Garmin Vista and really never went back to the palm.

A really neat thing you can do with the Palm GPS is take it apart and pull the GPS board out of it. You can hook a power source to it and it works with 2 wire serial (tx and gnd). You now have a little dedicated GPS. Pretty cool!

Thx, Terry

Subject: Re: [APRS] New setup

Warren,

Well, as it happens, I have been preparing for the arrival of the new radios
(the 'A700 and a TH-D7A(G)) for about a week and a half. I purchased a Palm IIIxe and I bid on and won a Rand MacNally GPS Navman GPS and Street Finder package.

I really haven't been able to find too much information regarding the Palm/Navman GPS combination on the web, but I am still looking. I think the
biggest problem with the Palm set-up is going to be the cable from the palm
to the TH-D7A, but again, I haven't spent a lot of time researching this.

My Lat. & Long. coordinates are not off by much at all...actually just about
one hundred yards, and your idea of using my own GPS to find a more exact position was, not surprisingly, one I never considered (I'm lucky to be able
to find my way home after work !!).

Subject: Re: [APRS] New setup

Don't feel too bad, on more than one occasion I forgot to put the negative
sign
needed by my program to tell it that I was in the western hemisphere. I was
finding myself in the middle of Mongolia!

If you have a map progam like Street Atlas, or just a GPS, Use them to find
your lat and long. Bear in mind that you're probrobably going to have to
deal
with decimal degrees. with some programs or the map program will tell you

the
lat and long using decimal degrees. So be aware of it and prepared to convert
it if need be.

a useful site for that is here

http://www.unn.ac.uk/~evgp1/gary/deg2dec.htm

Well, don't forget that there are now TNC's out that have a spare serial port on them. Also I recall that there are a few aprs programs that use a form of split cable that allow it to alternate between a GPS and a TNC.

As for wiring a lot of the various TNC's to a palm the PocketAPRS site had a lot of information on it

http://www.pocketaprs.com/wiring.html

I think all in all that if I was going to do a mod involving my Sony, I would approach the docking cradle first rather than going in to the case.

The big thing that has been pointed out in the VFAQ (very freqently asked question) from the site is that manufacturers seem to think that a good battery life is 2 hours for a palm So, unless you intend to set something up in your car so the palm in sitting in it's cradle while still connected to the TNC and radio, it will be a very short term operation.

Before you go charging off on the palm option I would set the unit down and see just how long it will stay on then ask yourself is it good enough.

I've stayed away from bluetooth (wireless headsets) for my cell phone because of poor battery life.

Well,

To all of you who so patiently provided possible solutions to my query, I offer this from Blue Hills Innovations:

Hi John,

My initial thought is that there would be trouble at the Palm com port, as it would be receiving serial data from both the radio and the GPS.

The only solution I could come up with is to put a 2.5mm connector on the Navman, and use a Palm-2.5mm TNC cable, so that both the Navman and the Palm could be connected to the two ports on the D7A.

My best,

Dave Sorenson

KC9DLW

Dave was VERY quick to respond and I really like his ideas.

My question now is...what do YOU think?

There is a commercial mobile charging cord for the Palm series I forget
who makes it, but a Google search for "palm mobile charger" should find it.

If you want to roll your own.... When my (now ex-) boss needed a mobile
charger for his Handspring I took a "travel charger" that I found at a
consumer
electronics place and whacked the wall wart off of it and replaced it with a
35mm film canister containing a 3-terminal regulator and a couple of caps
and a choke. You could probably do the same thing but add the pins and
conductors for serial communications to it.

From: John Schneider
Topic: 621 Message: 621

Well...this is the story.

After a couple of brief conversations with Dave of Blue Hills Innovations, I have decided to send him the Navman (and the Palm & TH-D7A(G) if necessary). He will modifiy it so that it connects directly to the radio (independant GPS for $50...not too bad). In addition he will provide a Palm-to-Radio TNC cable so that it can connect to the radio as well (all for about $45-).

When this is all over, I promise to post as comprehensive a review as I am possible of producing as a small thank you for all the great advice all of you have given me.

Now...as I hold my nose and get ready to jump in, wish me luck !!

626. Help please on an TNC-2

Yahoo group: APRS (1998 — 2006)
Date: 2003-04-12 08:49:15 UTC
From: Mike WA6ILQ
Topic: 358 Message: 626

Just picked up a MFJ 1274 and am trying to resurrect it.

Is there an on-line manual?

What is the power supply for it? Probably 12vDC
but is it tip positive or tip negative? And how
much current does it need?

Does it use speaker audio or can it use audio from the
top-of-the-volume-control ?
The RX I plan on using is a Icom IC-22U which lived
for a while as a remote base radio on a suitcase portable
UHF repeater and I already have the squelched repeat audio
on a connector... so using speaker audio or 600 ohm repeat
audio is as easy as picking one plug over another.

One major problem ...
The push-in/push-out 6 pole double throw selector switch for
HF/VHF has the handle broken off and I don't know if it is in
the VHF or HF position. If I can't find a new switch I will
have to unsolder the switch body and install jumpers for
permanent VHF mode. Any pointers to parts will be appreciated.

At the moment it will be hooked to an old P90 running Win 95 or
98 and some form of APRS software - anybody have any suggestions
as to what would be appropriate for a total newbie to APRS ?

Mike WA6ILQ

627. Re: Help please on an TNC-2

Topic: 358 Message: 627

Can't find an online manual. I know there's one for the 1270 but whether or not the power plug is the same is unknown.

Here are some links that may be of interest, though:

Radio to TNC:
http://users3.ev1.net/~medcalf/ztx/wire/tnc2.html

Digi setup:
http://www.qsl.net/ad4cr/mfjsetup.html

Some compressed files, don't know what they are, but they may be helpful:
http://ftp.ucsd.edu/arc.packet-radio.html

1270C manual (commands may be similar):
http://203.36.211.21/mfj1270c.pdf

Search the internet for MFJ-1274. This is where I found all these.

Good Luck.

632. Re: New poll for APRS

Yahoo group: APRS (1998 — 2006)
Date: 2003-04-13 22:52:55 UTC
From: Randy Allen
Topic: 630 Message: 632

In addition to not allowing multiple responses, another problem with the poll is that it does not list DOS.

It is my primary computer APRS software version (wether on a DOS machine or in a DOS window) mobile/portable when I'm not using my D-700's built in capabilities.

My home station is exclusively DOS (on a dedicated 486 with 4 Mb of proprietary RAM SIMMS. What else am I going to use that machine for?)

I'm not sure what the purpose of the poll is, but if you want a
good
feel forwhat software is in use, you need to include DOS.

636. Advice Wanted: All Station Query's Using DIGI/UNPROTO Paths

Yahoo group: APRS (1998 — 2006)
Date: 2003-04-13 18:13:04 UTC
From: va3jpx
Topic: 636 Message: 636

Hello Everyone,

I did a search for this in the archives, and was not sucessful in locating any similar discussions.

I am looking for the correct way to Query stations by using digipeater's that are not local to me. For example, let's say I want to see who's on the map in downtown New York City, and I am in Ottawa Canada. I can send an ?APRS? with a WIDE7-7,TRACE7-7 (for example) .. but this only gives me the results of the DIGIpeaters within a 300+ Mile radius and it does not show the users that are within range of the digi's.

Is there a proper digi route? OR do I have this all wrong? :)

Basicaly in a nut shell, How Can I route a query to a digi 1000 miles away (Igate'd or not), and have that digi send a query out, and send me the results?

Any help is greatly appreciated.

Thanks!

639. New poll for APRS UPDATED!

Yahoo group: APRS (1998 — 2006)
Date: 2003-04-14 13:57:37 UTC
From: va3jpx
Topic: 630 Message: 639

Poll has been adjusted as you all recommended.

Added Windows CE, Palm OS, and DOS. You can now have multiple selections.

Thanks for the feedback guys!

Why not just prevent all the "sniping" on what's not on the poll list by adding an "Other" category. If you get a bunch of entries there then you can do another poll for just those respondees.

643. APRS to IM Gateway

Yahoo group: APRS (1998 — 2006)
Date: 2003-04-15 04:43:57 UTC
From: grajohnt
Topic: 643 Message: 643

I just wrote a program that gates APRS messages to the AOL Instant Messenger service. I got the idea from the WU2Z email engine, and it works pretty much the same way.

Please note! I have just written this, and it's running on one of my PCs. I'm still developing it, and it hasn't undergone extensive testing yet, so don't be surprised if it is only up intermittently.

So, here's how to access it:
Send an APRS message to IM
The message should start with the user name of the AIM user, followed by a space, then the message. So, to send a message to AIM user AOLBuddy111, the message text would be, "AOLBuddy111 Hello there!". This is very similar to the WU2Z Email gateway.

The AIM user will receive a message from the AIM user APRSRelay giving the call of the sender and the message. Replying is not currently supported (see below).

The gateway is NOT bi-directional - you can only send messages, not receive them. While this is theoretically possible, I believe that it is illegal, because transmissions over amateur radio must be initiated by an amateur radio operator, and obviously over IM this is not possible.

Any comments?

-JohnT (KB5HWS)

644. Re: New poll for APRS UPDATED!

Yahoo group: APRS (1998 — 2006)

Good Idea. Done.

However all the votes get reset to zero everytime a modification is made to the poll. I wont do any further mods on this poll, its becoming more of a problem then what its worth!

645. APRS to IM Gateway

Yahoo group: APRS (1998 — 2006)
Date: 2003-04-16 01:37:13 UTC
From: grajohnt
Topic: 643 Message: 645

I've written some very basic software for gating APRS messages to the AOL Instant Messenger system. This is generally modelled on the WU2Z e-mail gateway, and works much the same way in practice. AIM is sometimes a better option for the short messages generated with APRS.

So, here's how to access it:
Send an APRS message to IM
The message should start with the user name of the AIM user, followed by a space, then the message. So, to send a message to AIM user AOLBuddy111, the message text would be, "AOLBuddy111 Hello there!". This is very similar to the WU2Z Email gateway.

The AIM user will receive a message from the AIM user APRSRelay giving the call of the sender and the message. Replying is not currently supported (see below).

From what I understand, replying to a message would be illegal, because it involves the initiation of an amateur radio transmission by a non-amateur. It is theoretically possible, but I will not implement it until I get word that it is legal.

The system is in a very early stage of development, so do not expect it to be up indefinitely in the future. It is only up for testing right now - I will bring it up permanently, if there is enough interest.

Any comments about the gateway are welcome.

-JohnT (KB5HWS)

PS - if this gets double-posted, I apologize, I sent an earlier version over 24 hours ago that never made it to the list.

Yes, this is possible (and probably quite easy), but it
would require a seperate server, and a different 'user' to
send the APRS message to.

If there's sufficient interest, I can do this, alternatively,
if there are any perl-savvy MSN users out there, I'd be happy
to make the code available for modification.

You asked for comments, so here goes.....

Sounds great. My kids have gotten used to AIM it would be beneficial if we could chat mobile.

As far as legality is concerned, here's my take on it.

When you make a telephone patch, you are initiating the call. The other party is able to reply and that reply is not considered initiation. So, if you send a message and they reply, I would consider that being initiated by you.

If you don't like that....how about this.

The station transmitting the message from them to you is (I assume) a licensed ham. He is allowed to pass third party traffic (isn't he?). So, he's just passing third party traffic to another ham. Unlike voice message passing which may relay third party traffic to another third party, this would always originate or terminate with a ham, right?

Surely between these two examples, one could convince oneself that it is legal.

649. Smart Track...anyone using this?

Yahoo group: APRS (1998 — 2006)
Date: 2003-04-16 03:07:31 UTC
From: dxxxxxbxx
Topic: 649 Message: 649

I searched the archives and can't find any regarding this device. This appears to be a device that connects GPS to radio without using a TNC+PC.

There is another device like this that is extensively covered on the internet and even has its own web page. However, the Smart Track seems to be just as functional and less expensive.

The Smart Track web page is at:
http://www.gctelecomar.com/smartracker

Is anyone using this? Would you recommend it? Is the manual/config data available on the internet somewhere?

Thanks.

I tend to agree with you, but I'd rather err on the side of
caution for now. I sent an email to the ARRL asking for their
opinion about this (I also used the phone patch analogy).

I think the best way to handle this is to set it up so that an
amateur must initiate an IM conversation, and the IM user must reply
within a certain time limit. A conversation could never be
initiated by an IM user.

That represents a fairly serious programming effort (due to the
bookkeeping of conversations), so I'd rather wait until I hear that
it's legal.

This is a COMPLETE ripoff of Byon's TinyTrak I/II/III. It uses the same HEX that Byon provided a while back. This guy is pawning it off has his own. I suggest you do not buy from him and buy from the ACTUAL creator Byon Garrabrant N6BG at www.byonics.com/

The smart tracker is another device like the Tiny Track devices which could be called a very dumb TNC since it can't decode APRS signals but it can broadcast them and the data from the GPS which is enough for a tracker. I and a lot of others are using Tiny track's in our mobile tracker set ups. My entire mobile unit constinsting of a Garmin 35 non display GPS, a tiny track unit and a two meter radio fits nicely in a 7.62 ammo box in the trunk of my car. I like the tiny track because you can configure it to be powered by the radio connection and the power can be passed on through to power the GPS as well.

May not be significant to you, but may be to others. One could always ask what is the most common digi/unproto that is in use? I suppose given the question, some would question the significance of the results as well. Can't please everyone.

All aside, there's been too much bickering over 'a poll'. No one has to take part in them.

Topic: 649 Message: 657

I wondered about this. The Smart Track is being sold for much less
than the TT3.

I have been monitoring the TT users group here on Yahoo. I have been
impressed by how responsive BG is to questions. Some of the
questions seem petty, but there doesn't seem to be any thing short
about his replies.

In this day and age of fast food employees, it is amazing to see this
type of customer service.

Thanks for the input. What evidence do you have that he is using the
same code? Is this folklore or has this been hashed out somewhere?

Hi everyone, I recently bought a Jornada 565 to use as a mobile data terminal,

659. Who hears me?

Yahoo group: APRS (1998 — 2006)
Date: 2003-04-17 04:54:18 UTC
From: tafische
Topic: 659 Message: 659

Is there anyway to tell in the raw APRS packet who the actual station is that heard my signal? Is it the one with the *?

I am curious to see how far my signal is reaching.

Thx!

660. Zodiac Chipset

Does anyone know the purpose & usage of the following NMEA
sentences? PRWBIT PRWILOG PRWINIT PRWIPRO ??
These are "proprietary" constructs associated with the Rockwell Zodiac GPS
chipset. I've found the binary formats, but not the NMEA's.

I delete the Poll, seeing how all you guys have nothing but
nagative things to say about it, ever since I posted it.

Why dont you create a poll that suits your fancy instead of
complaining about it?

Actually I don't think it was saying bad things about your poll. It was and is a good idea. The problem may have been that you weren't expecting so many different combinations of GPS, computer and TNC's or trackers. Perhaps, if the choices were decided on the list then the poll started, you might get better results.

Suggestions for polls

What TNC do you use (not including broadcast only)
A. AEA brand
B. Kantronics brand
C. Built-in radio TNC (Like the Kenwood 700 model)
D. Software and sound card
E. Other

A second poll

Does your Moble tracker have the ability to decode and display? (This being the custom built smart units) Results of this poll might need more input
A Yes
B No

What do you think? Don't try and add exact match entries for your own combination. Be general but a bit clearer. such as a manufacturer I left out. If this resolves right I or someone can go ahead and post the poll. Then the data can be collected.

> is not possible.

John
I like the IM service idea, very cool.

As for replies - I say it's perfectly legal. Whatever is sent out over
the air is the responsibility of the person who transmits it, in this
case
the igate who is near the original APRS message sender. The entire
internet portion of the APRS network is unregulated, and aside from the
general agreement that if you log in with a password you assert all the
traffic is valid,
there is no responsibility on your side. If the IM user were to curse,
for example, I think it would technically be a violation of the station
that actually transmits it over the air... unless I misunderstand the
regs. If you're on autopatch and the landline party curses, is it a
violation of your license or of the control operator of the
repeater? Maybe since you are remotely controlling the repeater at the
time, it is on your hands, and maybe that applies to packet also, but
either way it's not a violation of the license of the person who hooked
up
the telephone on the far end, which is essentially what your service
does.

What about the ability to check the status (online, away, etc) and
retrieve away messages from buddies... That would be a nice
feature... like, send a message to "IM" that says "status? buddy1 buddy
2
buddy3" etc.

Topic: 643 Message: 666

Thanks for the suggestions, a method for retreiving buddy status would definitely be useful. I'll try to incorporate that this weekend.

As for the legality...it's actually a bit more complicated than that. According to Part 97.219(b), the 'responsible' station in any message forwarding system is the one that originated the message, which would be either me or the person who sent the IM. I am required to authenticate the identity of the station, and accept accountability for any rule violations. Since I'm not actually operating a station, I can probably do whatever I want, but relay stations are obligated to block traffic from anywhere that violates the rules. So what you suggest would work for a little while, but not for long :)

Just to really blow your mind - the implications for sending traffic to an IM user in a country that doesn't allow third-party traffic are really fuzzy. Technically, I think this is illegal, but if the intent of the ban is to prevent communications from reaching that country via amateur radio, this doesn't do that at all. It's really no different than sending a message via amateur radio to another operator in the US, and then having him/her fly to that country and pass the message in person. It's really the merging of amateur radio and the internet that makes this issue confused.

Hopefully you will inform everybody prior to allowing unrestricted messages to go from any IM user back out to RF via an IGate? I want to be sure to have mine disabled for good before THAT starts happening. My IGate, like most, runs 24 hours a day, 7 days a week. I'm sure not going to accept responsibility for everything anyone on IM wants to type.

Actually, I don't think the APRS IGate client programs will allow that anyway. Currently, in order to get gated from the internet to RF, I believe the message has to come from a registered APRS program. And I don't think you can register one if you're not a licensed ham. That's why we don't have 2-way email on APRS yet. So I guess I don't have too much to worry about.....

This might add a little work, but maybe try to include something that only licensed Hams could use the Internet to RF IM messageing....Say for example the screenname has to be a callsign and those can be easily verified against the databases. So a ham could go from APRS to IM to any screen name, but only licensed, registered and verifed hams (registered/verifyed by the callsign Screenname) could reply back to APRS via IM. That way, everybody is covered?

No. IM Can;t control that. But there could be a subroutine in the "APRSrelay" IM gate to check the Screenname against the FCC or whatever databatabase. Anyone who would want to use the IM to APRS gate would have to be informed of that.....Does that make better sense?

671. RE: [APRS] Re: APRS to IM Gateway

Yahoo group: APRS (1998 — 2006)
Date: 2003-04-17 22:00:44 UTC
From: Ron Cluster
Topic: 643 Message: 671

So what's to prevent me from choosing a screenname of say kd5thq? Not my callsign.

What would prevent a non-ham from doing that same thing?

73.....Ron.....AC7TK.....(-9 when mobile)

Subject: Re: [APRS] Re: APRS to IM Gateway

No. IM Can;t control that. But there could be a subroutine in the "APRSrelay" IM gate to check the Screenname against the FCC or whatever databatabase. Anyone who would want to use the IM to APRS gate would have to be informed of that.....Does that make better sense?

Your use of Yahoo! Groups is subject to http://docs.yahoo.com/info/terms/

672. Re: APRS to IM Gateway

Yahoo group: APRS (1998 — 2006)
Date: 2003-04-17 23:16:09 UTC
From: grajohnt
Topic: 643 Message: 672

Let me make it clear that I don't think my system will *ever*
allow internet-originated messages, either from hams or non-hams.

What I *do* think is legal, and will probably happen, is for a ham
to be able to initiate an IM conversation with an internet user, and
to allow that user to respond within a certain time window (say, one
or two minutes). This would be similar in practice to a phone-
patch, and would be very useful for many hams. It's not acceptable
for any call TO a phone-patch to make it onto the air, but once
established by a ham, a non-ham can talk on the air.

673. RE: [APRS] Re: APRS to IM Gateway

Yahoo group: APRS (1998 — 2006)
Date: 2003-04-17 23:32:34 UTC
From: Ron Cluster
Topic: 643 Message: 673

I'm not up on the legalities or the semantics of what is or is not an "internet-originated message" so I'll leave that up to somebody who is.

I don't think the current breed of APRS client programs, (WinAPRS, UI-View, APRSPoint, etc) will gate a message from the internet to RF when operating as an IGate, unless that message comes from one of those client programs and that client program is registered. That gives all of us IGate operators the protection that we need to allow internet to RF gating to occur at all. I'm not a programmer though, so if somebody knows differently please correct.

I'm not against this idea, don't get me wrong. I just think there are quite a few problems to handle before it can go mainstream. I think we would have seen "reply to APRS email" happen by now if we could get the verification issue solved.

Your use of Yahoo! Groups is subject to http://docs.yahoo.com/info/terms/

674. Re: APRS to IM Gateway

Yahoo group: APRS (1998 — 2006)
Date: 2003-04-17 23:52:33 UTC
From: grajohnt
Topic: 643 Message: 674

Right now, anyone can log into the APRS-IS servers and get the feed, but you have to be a registered user to submit messages into the feed - it doesn't have to be a registered program, just a registered user. I won't be submitting *anything* from the internet using this server until I am fully satisfied with the legality of it, and with the agreement of the APRS-IS sysops. So don't worry - your IGate is safe :) . Once I hear back from the ARRL legal folks, things should be a bit clearer.

675. Re: Smart Track...anyone using this?

Yahoo group: APRS (1998 — 2006)
Date: 2003-04-18 01:39:39 UTC
From: J. Rausch
Topic: 649 Message: 675

I got the information straight from Byon himself. He managed to get ahold of one I beleive and saw that the HEX was exact to his. I have NO reason not to beleive him. It's very obvious that its a pure ripoff. Look at the list of features! and SmartBeaconing, I bet he never asked Steve Bragg KA6MVA for the permission to use that! I know Steve from the HamHUD group http://www.hamhud.net and YES, this was "hashed out" before, right on the TinyTrak Yahoo group. There was big uprising of support for Byon and to pound this THEIF into non-exsistance. I feel very strongly about this type of thing. I hate to see people's hard work copied and pawned off as someone eles's. That infuriates the hell out of me. I have found many websites that link to my project on my homepage, but none are claiming the ideas as their own and I'm ok with that. But I did find someone who used one of my schematics in an article and did'nt even give me credit for it and that just pissed me off. I wrote the author a nasty email and never heard back from him.

From: dxxxxxbxx
Topic: 649 Message: 676

Thanks for the input. I'll check the TT group and look for
that "hashing out".

I purchased a TT3 today. I already have the GPS, radio, and cables
for a Kantronics TNC, so I assume I'll be ready to use it the day it
arrives.

I emailed the Smart Track guy and asked a couple of questions. He
was very responsive. I believe he is in Argentina. Probably hard to
do anything about a "rip off" there. It would probably cost a
fortune to have any legal help regarding this. If the software isn't
copyrighted it may even be more difficult.

I was disappointed in the Smart Track not having any documentation or
configuration software available for download until "after" you buy.
TT has all that stuff on the Web so I can see what features there are
and how hard (easy) it is to configure. I wonder if the Smart Track
software and documentation is copies of the TT stuff.

Nothing really I guess, but I was just thinking and thought I would suggest it. I really honestly wasn't sure how it could be implmented, but it was just a thought. Course I agree that internet users shouldn't be able to initiate messages because of legalities, but I think the over al system is a good idea and somethign to experiment with.

I guess we'll have ot wait on a final "ruling" on the legalities. Like I said above, I think this might be fun to play with and experiment with since that is what Ham Radio is all abouy. The only legality issue that could come into play is the control op thing. Technically, isn;t the ham who initiated a phone patch responsible for the operation and then the control op of the patch, includeing but not limited to the offical control op of the repeater? ?f the person they call says somethign that shouldn't be said, the person is supposed to shut down the patch. How do you "shut down" the IM if the time hasn't expired yet.? When the internet person replies is the timer reset or does it reset only if a reply comes back from the APRS user? Just a couple of other thoughts.

Jeff

678. RE: [APRS] Re: APRS to IM Gateway

Yahoo group: APRS (1998 — 2006)

From: Terry A. Fischer
Topic: 643 Message: 678

If you're saying - what is to prevent a non-ham from cheating and making up a call sign to use the system -- what about a non ham buying a ham radio and pretending he has a call sign? Same kind of thing isn't it? I don't think you can not do something really cool because someone might break the rules.

The other possibility to keep this 'legal' is to have the Ham IM users register and only let messages initiated from registered users pass through. That way at least you put some checking on it.

When many of the current rules were put in place I don't think any of us had any idea what was to come with the internet and technology. It is with the creativity of fellow hams that we have things like SSTV, APRS, etc.

Keep up the good work!

So what's to prevent me from choosing a screenname of say kd5thq? Not my callsign.

What would prevent a non-ham from doing that same thing?

No. IM Can;t control that. But there could be a subroutine in the "APRSrelay" IM gate to check the Screenname against the FCC or whatever databatabase. Anyone who would want to use the IM to APRS gate would have to be informed of that.....Does that make better sense?

679. Great GPS Price

Yahoo group: APRS (1998 — 2006)
Date: 2003-04-18 14:30:46 UTC
From: tafische
Topic: 679 Message: 679

Ok - I might get flamed for this, but I felt it was appropriate to share the great deal I stumbled across.

Amazon has the Garmin Etrex Legend 8mb with data cable for $139 after rebate.

Too bad I paid just paid $200 for mine :(

Anyway - I hope this helps someone looking for a GPS.

680. Re: APRS to IM Gateway

I'm going to reply to comments from a few different people here:

> the message has to come from a registered APRS program. And I don't think
> you can register one if you're not a licensed ham. That's why we don't have
> 2-way email on APRS yet. So I guess I don't have too much to worry

Actually, this isn't true. The source code for the "password" calculation is available on the internet. You can download it and compile it, and enter anything you want for your "callsign" and then it will generate the appropriate "password" for that callsign. Then you can login to an APRS-IS server via telnet, or a program you write your own. If you really want, you can even configure some of the currently existing programs to allow you to login without actually registering the program.

So, anyone who wanted to send a message from any callsign they want already can, though it takes a little bit of effort.

> No. IM Can;t control that. But there could be a subroutine in the
> "APRSrelay" IM gate to check the Screenname against the FCC or whatever
> databatabase. Anyone who would want to use the IM to APRS gate would have
> to be informed of that.....Does that make better sense?

IF you wanted to restrict this to hams only replying, the IM gateway could ask for callsign and some other info... first name, zipcode, etc. Of course, anyone with QRZ.com can easily spoof that, and this might not work with non-US stations.

Here's a better idea: Has anyone seen the AOL IM forwarding feature? It has some similar behavior. First of all, the point of the feature is that when you log off from AIM, it automatically re-logs you on - BUT it logs you on with the "mobile user" indication, so people using AIM know that you're on a cellphone (little cellphone icon - APRSRelay should have that) - they already know to send you short messages. THEN, when somebody goes to send you a message, it autoreplies with: "Auto response from SCREENNAME (12:48:57 PM): Your IM has been forwarded to my cell phone and, although I can read your messages, I cannot reply. Thanks for your IM!Want your IMs forwarded to your cell phone? Click here." (You'd think they would learn about the right place to put commas.)

If you have SMS on your cellphone, you can try it out here:
http://my.screenname.aol.com/_cqr/login/login.psp?siteId=IMFmain&authLev=1&mcState=initialized&triedAimAuth=y

ANYWAY, the APRS-IM gateway could autoreply with some sort of message about what the "rules" are regarding sending messages and then say "would you still like to send this message?" and wait for a yes/no...

In addition, it could pretty simply filter for reject for various inappropriate language.

Topic: 643 Message: 681

Adam,

These are good ideas - I don't know if the protocol library that
I use will allow me to log in as a 'mobile' user, but I will see.

The system already does what you suggest, to some extent. When
you get a message over IM from a radio user, there is a link within
the message that takes you to a FAQ page. This can be easily
extended to include rules for replying.

In the reply system, the program will auto-truncate messages so that
they fit within a single APRS packet. We are all used to truncated
messages, especially those of us who use SMS and get e-mail on our
phones. It will, of course, also filter out any bad language, and
perhaps warn the user sending it.

In terms of being a control operator - this is no problem - I can
always stop the script. It's now possible even to do this over IM.

How long ago did you "just" buy yours.

Many places have 30 day "best price" policy and will refund the difference. If they have a no questions asked policy, return it and buy the cheaper one.

Good luck.

683. APRS -> Yahoo IM Gateway

Yahoo group: APRS (1998 — 2006)
Date: 2003-04-20 15:18:51 UTC
From: grajohnt
Topic: 683 Message: 683

The APRS -> IM gateway now supports Yahoo! Messenger.

Messages are sent the same way as AOL messages, but send
the APRS message to YIM instead of IM.

Yahoo messages do not quite have the functionality of AIM messages,
so some of the features of the gateway may never exist for Yahoo.
They have never published their protocols, so the module used to
build this support in is not as stable. Two-way messaging, if ever
supported, will be difficult, but not impossible, to add in Yahoo.

For those of you who requested it, MSN is next on the list.

Send an APRS message to user YIM.
The body of the message should start with the name of your buddy,
followed by a space, then the message.

Something like this:
MyBuddy this is a test.

Will send a message to MyBuddy consisting of 'this is a test.'

From: A. Wesley Jones
Topic: 688 Message: 688

I have a problem and I think it's with my WinAPRS setup but I'm not sure. I'm running a tracker using an Alinco DR-135TP. I had not used it for a few months and just began running it again. It seems to be working fine, transmitting every 60 seconds and is showing up on the map at my office location. Just to make sure everything was okay, I did reset the TNC and put in the same parameters again. The problem is, I don't show up on findu.com (w2emo-9) and I know my office station (WC2AGO) is not retransmitting my information. This setup I have at the office (EOC) is new and different from the equipment I was succesfully using before. I have a new KPC3+ and am using WinAPRS. I set have tried a couple of different things with the path line, including RELAY,WIDE and W2RGI,WIDE (closest digi). Since I know my mobile was working properly with the parameters and the only thing that is changed is my office setup, I'm sure that is the problem. Please help!!! Thanks and 73'sWes, W2EMO

From: Mario Amaral Filho
Topic: 689 Message: 689

Hello all, I am new to this group.

I work in the agricultural industry in Brazil, I would like to track, within a critical detail level, via GPS & Ham radio, vehical, tractors, combines and other ag machiney on my computer, is this possible, how could I do this?

Is there anyone who could help me out on this subject.

I appreciate you time and effort.

Thanks,

Mario Amaral

690. APRS in a bottle

Yahoo group: APRS (1998 — 2006)
Date: 2003-04-21 16:35:26 UTC
From: surbahars
Topic: 690 Message: 690

I started a discussion over in TinyTrak (a small APRS unit) that I would like to share for a short time here.

For no particularly good reason I have always liked the idea of a bouy in the ocean, floating with the current, that would report back to me. Maybe it is the intellectual challenge... maybe the Walter Mitty in me who would like to cross oceans myself but never will.

So we started talking about what one member called APRS in a bottle.

The idea.. still a day dream.. is to release a free floating bouy in an ocean, river, stream, or lake.. and use APRS to keep track of it.

More than that... we wonder about keeping track of wx data. Or how about sending some sound clips or pictures?

We know that this is being done by both the US and Canada governments. I know there was a talk by a fellow at some ham convention about doing APRS bouys commercially.. there is a RealAudio file on the net about it.

But can WE do something like this? There are many groups that do those balloon launches. What about water launches?

The TinyTrak group is about issues and ideas relating to the TinyTrak unit. So the discussion doesn't really belong there. This group is devoted to the general issues of APRS. If anyone is interested I would guess the list owner wouldn't mind a little bit of talk about it here.. then if you are interested you can migrate to a group I started... APRS in a Bottle.

http://groups.yahoo.com/group/ham_bottle/

Here is group description.. or part of it..

"For the fun of learning, we want to develop an APRS in a bottle. This could serve as a fixed position bouy to report boating conditions in a local lake, or it could be set adrift and gather and send weather and water data. Cooperation, learning and education are the keywords here. Let's help each other. Share talents, share learning. Involve kids if possible. The journey of development is as important as the end result."

I don't want to hijack this group.. but could we brainstorm a bit here before we go? There is quite a brain trust here.

There are many issues.. technical.. legal.. practical.

Small streams have many snags. Large stream have dams. Oceans would require the use of APRS SATS. In bodies of water even as large as Puget Sound the unit would wash onto the shore or rocks in short order. (But balloon flights last just a few hundred minutes) Marine growth on sensors. Too small and batteries are a problem. Too large and you could be a hazard to navigation.

But those challenges and many others are what makes ham radio fun for some of us.. right? Will this happen? I don't know. We are all busy.. I sure am. But maybe....

Any thoughts?

Bryan

Super!

I don't know enough about SAT APRS. Any issues with water and
antennas? Salt. Waves. I assume non-directional would be best..
with a the base far enough away from the water.

This page.. while old.. has a design I thought interesting...

http://web.usna.navy.mil/~bruninga/buoy.html

I guess it also shows there is nothing new under the sun.

The idea of making the APRS in a bottle literally bottle size does
have an appeal though. Cost control for one. But batteries would be
rough in that small a space.

Hi all from Spain
back in november 2002 someone in Argentina did that but transmitting only in CW.
I made a site in spanish with some pics and is still available at.
http://www.radioaficionados.info/boya.html

So, doing it in APRS would not be much more difficult (In HF)

Hope it helps

697. Digipeater/Nodes

Yahoo group: APRS (1998 — 2006)
Date: 2003-04-22 01:11:55 UTC
From: Bill Reid- VE3VWD
Topic: 697 Message: 697

Hello All

I have a question that seems to bring about many varied answers.

In southern Ontario, primarily Toronto we have installed a new Node in the center of the city.

We would like to get all the nodes within 3-4 hops of this area setup properly. But we are getting conflicting stories.

Is there anything wrong with the setup of this digi?

Is there somewhere I can find out about the routing of packets through Digi's?

If need be I can direct email a map showing local digi's etc.

73
Bill Reid
VA3QB/VE3VWD

<.....Information.....>

A member did some stats as follows :

Total Packets Heard = 45025
Duration of Monitor Time = 1320 minutes(22hrs)
Recommended optimum = 12 packets/min
Packets / min = 34.1 (184% over optimum)
Assume 1.0 sec./pkt = 34% channel loading
10,238 packets had VE3VWD as a digi
10238/45025 = 22.7% of heard packets
VE3VWD digi'd packets from 148 stations

He states that the digi is over loading the area based on the above stats.

This is the configuration of the Digi
UIDigiCall = RELAY, WIDE, TRACE,
UIFloodCall = WIDE
UITraceCall = TRACE
Beacon1Interval = 600
Beacon2Interval = 1800
Beacon3Interval = 3600

I do not know about Brazil, but here in the USofA we aren't allowed to use Ham radio for commercial purposes. This sounds like a commercial venture.

Of course, if it is your farm and you are just interested in tracking your own equipment for purely hobby/recreational purposes, that is another story.

You may want to look in to some other type of radio service. Here we have MURS which is a 2-watt unlicensed service. If this is your own farm you could probably keep track of your equipment with something like that. (Of course, I do not know how big your "farm" is.) That way the issue of using Ham radio for commecial interest is irrelevant.

Still, I would estimate it would cost US$250-500 per piece of equipment and you'd still want a base station to tie it all back to. This would not be much more expensive, except you'd probably want a tall antenna.

I grew up on a farm myself in central Kansas and would have loved to have something like this to keep track of the family and stay in touch.

Would you care to share more details with us Mario?

From: tafische
Topic: 699 Message: 699

I am new to APRS and found the info to use PCSAT yesterday. VERY COOL! I tried it yesterday and it worked like a champ.

I also found information for using APRS via the Space Station, however I can not make contact. I have found some information saying it was offline. Can someone give me the full scoop on the ISS?

Thx!

700. Re: Satellite is cool! ISS?

Bouncing APRS messages off of satellites is great, isn't it?

The packet system on ISS is down. The best way to keep up on the
latest info on ISS (and PCSat) is to read the AMSAT News.

http://www.amsat.org/amsat/news/ans.html

The weekly satellite report gives you information on the operational
status of every amateur satellite in the sky. Make sure to read
(and follow) the current notice on PCSat (NO-44).

703. APRSserv problems

Yahoo group: APRS (1998 — 2006)
Date: 2003-04-22 14:15:09 UTC
From: kb1ejw
Topic: 703 Message: 703

I am trying to run WinAPRS on the internet, but it appears my APRSserv.txt file is corrupt. Does anyone have the txt file set up that is working? On my file, it looks like it is encoded or something. It has several weird digits and things and no servers listed, and WinAPRS won't connect to anything.

Thanks

Jeremy KB1EJW

From: dxxxxxbxx
Topic: 702 Message: 704

MURS is an "unlicensed" service in the US. You may or may not have something similar there.

I do not believe MURS would save you any cost. It is just a different radio service with a different set of frequencies and regulations.

For each piece of equipment you wanted to track, you would still need a radio (MURS, Ham, or whatever) TNC (or TinyTrak device) and a GPS.

The GPS determines your position on the earth.
The TNC receives information from your GPS and connects to your radio to transmit the information.
The Radio .....

I would think you would still be looking at US$250-500 per piece of equipment you would want to track. I do not know how familiar you are with the radio regulations in Brazil. I'm certainly not. You may want to look at:

http://www.anatel.gov.br/home/default.asp

and see what unlicensed services there are available (if any). There is also a link with information on Ham radio. I do not understand the language (typical American) so I can't point you to anything beyond the initial URL.

Ham radio operators here are sometimes friendly and willing to help out. If you can find one in your area, maybe he can help you with APRS, whether using Ham radio or some other service.

Good Luck.

Now there are non ham versions of gps tracking equipment. There are many commercially made systems that can be found simply by using the google search engine and typing in GPS vechicle tracking.

Which depending on if you want it real time or just logging where it went

Depends on the application. I've used several. They are good if you need a "fire and forget" radio that doesn't require flexibility and you need a low "theft attractiveness" quotient. And you can't get much simpler -- plug it in and turn it on. My home APRS weather station has been running on one pretty much non-stop for two years. It's a brick.

I assume you're referring to a Kantronics KPC3 Plus when you say KP3 Plus.

I don't have this setup, but I do have a KPC3 (no plus).

The GPS input uses the same port as the computer interface, but you have to give it some keyword to set it in the GPS mode (as apposed to KISS or normal). You also need the correct ROM version to support this (although it may be inherent in the Plus). I believe the Kantronics web site has user manuals and info on the correct ROM.

Hope this helps, if not, I apologize for wasting your time.

You may not be a "losey" electronics nerd, but you may qualify as a lousy speller!

720. Servers with Port 23

Yahoo group: APRS (1998 — 2006)
Date: 2003-05-01 18:53:48 UTC
From: tafische
Topic: 720 Message: 720

Are there any APRS servers out there that have full feeds on port 23? My firewall blocks all but the common ports.

722. Question on unproto paths

Yahoo group: APRS (1998 — 2006)
Date: 2003-05-01 17:38:04 UTC
From: stevejm29
Topic: 722 Message: 722

I understand how relay, wide, callsign and such work in a path but what is the reason "APRS" is in a path?

Example: APRS,relay,wide,callsign

Also seen it in the format

APRS via callsign

Whats the purpose of "APRS" in a path and when would these two methods of it be used?

Steve

723. HF APRS

Yahoo group: APRS (1998 — 2006)
Date: 2003-05-01 21:11:48 UTC
From: n1xtk
Topic: 723 Message: 723

Hi everyone,

I was wondering how to send APRS on HF. I have been doing it on VHF for many months now but I am wondering how to do it with HF. I could use (for a tnc) a tiny-track or a mfj 1278 or a kantronics kpc3+. For a radio I could use a icom 746 or for camping I would like to use my yaesu ft-817. I just wonder about freqs and the actual setup of the tnc. If I did it on hf is there a gateway to the internet so that I could be seen on findu.com or another internet url.

Thanks,
Keith

HI all,
Some time ago I read somewhere that there is a way to send emails using APRS on HF.
Is that true? any hint?
Thanks in advance and have a nice weekend

The APRS in the path goes back to 'traditional' packet radio. In traditional packet radio, your TNC would connect to another TNC via the radio and you would have a two-way conversation. Contrast with APRS, where you basically have an infinite-way conversation.

This was great, except that you had to be able to hear the other party's radio/tnc direct. That's when digipeaters came in. You would specify, by callsign, the digipeaters you wished to relay through, and they would do so.

So the path evolved to:

MYCALL>TOCALL via DIGI1,DIGI2

where MYCALL is my callsign, TOCALL is your desired destination station, and the digi list is obvious.

With APRS, there wasn't a specific TOCALL, because you wanted everyone to hear/see your packet, so the APRS specification calls for any TOCALL that starts with "AP". The most basic would be "APRS". APRS client programs use the rest of the TOCALL bits to identify what version they are. For example, WinAPRS 2.6.1 may use the the TOCALL "APW261".

There is another use for the TOCALL in APRS that doesn't require it to start with "AP". It's a feature called "ALTNET" and not all clients implement it. It changes the TOCALL to the name of your ALTNET; something like "SCOUT". All stations participating in the scouting event would likewise set their ALTNET or TOCALL to "SCOUT". Then all the scouts would see all the other scouts, and wouldn't see any other stations. Kind of like your own private APRS group, but on the same frequency as everyone else. (Of course it's not really private, everyone else can hear your packets, but their client program may not display them unless they change their ALTNET to "SCOUT" also.)

Whew, a long explanation. Let me know if anything doesn't make sense.

Nice job of a clear explanation. So many messages ramble and don't
get to the point.

I'll stick a few keywords in here so "beginners" may find it when
they are "starting out" as a "new aprs user".

I thinking I'm following you here. So if you would use APW261 you wouldn't have the need for APRS? Then the receiving end would have to have the correct syntax of APRS in order to received the packet?

So what is the correct syntax to use in my path?

APRS, relay, digi, wide

or

APRS via digi, relay, wide

I did have my D700 mobile set at

APRS, relay, digi, wide

and couldn't seem to hit the digi until I changed to

relay, digi, wide.

I did find the APRS specifications pdf and will read thru that.
Looks like a lot of material in there.

Steve

728. Wide, Relay, APRS, etc. ?

Date: 2003-05-02 15:46:11 UTC
From: k9ftb
Topic: 729 Message: 729

I'm new to APRS and am somewhat confused about the terms in the subject line. I'm using UI-View32 connected to the internet and I see loads of "signals" - after looking the details for any callsign, there is a wide variation in the details related to APRS, WIDE, RELAY, etc. Sometimes I see a callsign, sometimes I don't.

So I'm confused. Is there a "fundamentals" primer on the terms used and the meaning. I feel I coould make sense of it all, if I understood the basics first.

Any suggestions would be welcome.

Yes, the APRS or APW261 or other TOCALL (as long as it starts with AP)
is appropriate and all other APRS clients will receive it properly.
There's nothing special about the TOCALL of "APRS" except that it
starts with "AP". Any APRS client program will (should) accept the
packet as long as the TOCALL starts with "AP".

> So what is the correct syntax to use in my path?
>
> APRS, relay, digi, wide
>
> or
>
> APRS via digi, relay, wide

Keep in mind that the TOCALL is not actually part of the UNPROTO PATH.
The path is the RELAY,WIDE,... stuff. The "APRS" or "APW261" or
"APX114", etc., the TOCALLs and those are set by the APRS client
program (or D700) and usually aren't changeable.

> I did have my D700 mobile set at
>
> APRS, relay, digi, wide
>
> and couldn't seem to hit the digi until I changed to
>

That's what should have happened, because by setting the PATH to the
first one you listed, you are saying "digipeat my packet to a
digipeater with callsign APRS, then to a digipeat my packet to one
with callsign (or alias) RELAY, and so on. But, I doubt any digipeater
answers to the alias "APRS". That's used as TOCALL, not a digipeater
in the PATH. It's important to remember the difference between the
TOCALL and the PATH, even though they appear together. The TOCALL is

the callsign right after the "From" callsign and the rest after that are the PATH digipeaters (or aliases).

I'm not sure if by "digi" in your path list whether you mean you actually put in the letters d-i-g-i, or if you put the callsign of a spcific digipeater. RELAY and WIDE are proper APRS digpeater aliases, but DIGI means nothing special in APRS. Something more appropriate might be RELAY,WIDE or RELAY,WIDE,WIDE or (to try something new) RELAY,WIDE3-3, which is a special notation for RELAY,WIDE,WIDE,WIDE, but without the ping-pong effect (digi1 answers to the first wide, digi2 hears the digi1 packet and answers the 2nd wide, digi1 hears digi2s packet, which it already digipeated, but goes again anyway).

> I did find the APRS specifications pdf and will read thru that.
> Looks like a lot of material in there.

There is quite a bit of stuff in there. For starters, maybe skip over the parts about building the AX.25 packet and where the bits go and such. It's of use to APRS client programmers, but I think it would be rare that anyone else like us would find it useful in normal use.

Have Fun with APRS!

Your path and UNproto are 2 differant things, Set your unprotocol to APRS and set your path to RELAY,WIDE2-2 and it should work just fine, unless you are in Los Angeles. But thats a different story. The terms relay and wide are acually call signs themselves. They are generic call signs that the digipeater is set to respond to. Since most every regular aprs digipeater nationwide is set to respond to a path of WIDE then it means if you set your radio to a path of WIDE your packet will get digipeated no matter where you are in the country. this is what makes the whole thing work.

Date: 2003-05-05 16:30:25 UTC
From: Phil Reed
Topic: 732 Message: 732

You don't need to put the "APRS" in the path -- the D700's TNC will do it for you. (In fact, the D700 will actually use something like "APK101"; "K" for "Kenwood" and "101" for a version number.

A good generic path would be something like "RELAY,WIDE2-2" (except in southern California, where they ignore the "RELAY").

All
2 questions regarding radios w/ built in APRS abilities

1. Do any of the radios include abilities like tinytrack has where it can "wake up" itself + a GPS even when powered down, get a fix, and send the location?

2. Can anyone comment on the alicno Dr-120. It seems like it's been out since october, but I can't find too much information on it. I was looking at it as a cheaper solution than kenwood, but now that I think about it - it doesn't come with the TNC module... adding that only makes them $60 different.

From http://web.usna.navy.mil/~bruninga/pcsat.html

END OF MISSION: PCsat was in full sun 10-20 April 2003 and continued to be power positive until 26 April. At that point it was back into heavy eclipses and the batteries are so weak that even in the sun, they can barely support a single packet. I'm declaring PCsat mission as complete. It operated reliably for 19 months and supported over 2000 users worldwide. We were seeing typically 50 users in each 8 hour period on pcsat.aprs.org. So she was well used up until the end. We will leave her ON for continued experimentation, but the only packets you can get through PCsat now are very short ones.

740. Bouy idea down da drain? Was -- Goodbye PCSat

Yahoo group: APRS (1998 — 2006)
Date: 2003-05-07 19:28:59 UTC
From: Dave Schmidt
Topic: 738 Message: 740

Dang! So much for the idea I was kicking around in my mellon... Someone mentioned putting an APRS bouy in the ocean a while back... that sparked an idea here and I even drew up some plans and put together a parts list for my "for giggles" APRS with WX data ocean bouy project . I was planning to use PCSAT with this system ... so much for that idea.

I even started gathering up equipment for a smaller version that I could plop in Lake Winnibago or lake Michigan just to tinker with and work out the kinks.

Is there any other sats I could use with packet/aprs? Is there any sats in the making that will take PCSATs place?

Thanks

Well, there are other APRS digipeating satellites, but none of
them are quite as easy to hit as PCSAT (was).

According to Bob's PCSAT page:

"PCSAT FOLLOW-ON MISSIONS: There are two PCsat type digipeaters in
work. ANDE Is a 1 year battery powered digipeater and PCSAT2 is a 1
year external attachment for the ISS. "

I suspect that anything going up to the ISS is on hold right now - I
think they've got their hands full with the logistics of station-
keeping, etc. right now.

I am a newbie. Are there other packet sats? Also... I have having a heck of a time with software. I run, sad to say, Windows XP. PakTerm, I think it is called, runs OK. But I can't get WinAprs or APRS+SA to work. In fact, when I run the latter it makes PakTerm stop working. I have to restore my system to make it work. PafRatt doesnt work either. Now, I don't really know what I am doing.. because I am a packet newbie and much of the installation stuff is just plain wrong or it doesn't explain things in low enough terms... but... Any ideas? Thanks for the help. Bryan

And I started an APRS in a Bottle group! We would love to have you join. I also have gathered the parts required. MIM chip. Old xmitter. Working on getting the GPS. But I, too, will launch it first in Lake Washington or Puget Sound where I wouldnt need the sat. Could you share your APRS in a Bottle idea? I will share what I have. I have been looking into various interfaces using a stamp.

Dave Schmidt <cworksmidwest@...> wrote:Dang! So much for the idea I was kicking around in my
mellon... Someone mentioned putting an APRS bouy in
the ocean a while back... that sparked an idea here
and I even drew up some plans and put together a parts

I was also new to the SATs. I was able to talk to it twice and got some telemetry a few other times. It was really cool.

Someone else help me out here if I am wrong, but I don't think there are any other APRS sats up there right now. Maybe with PCsat down they will push a little harder for getting the IIS system back online.

I sure hope so....

thx

In theory, it's possible to send APRS packets via UO-22, but
I haven't personally tried.

ISS has a full APRS digipeater inside of it, but
it has been turned off since the accident. They will
probably turn it back on when they get a chance to
play radio again. PCSAT2 is going to be an APRS
digipeater mounted on the outside of ISS on the solar
panel array. It should not have battery problems like
pcsat did. ANDES is going to be some kind of a
satellite that will work on APRS. There is full
information at Bob Bruninga's web site.

Subject: [APRS] Goodbye and software glitch

I am a newbie. Are there other packet sats available?

Also... could I ask some help on a software issue?

I run windows XP... not a great piece of software. I can run a program called something like PKTerm.. but I cant get WINAPRS or APRS+SA to run. WHen I run the install for APRS+SA it also makes it so that PKTerm doesn't work anymore. Any thoughts on how to get these to work? It is frustrating for a newbie cuz the install instructions seem to be based upon earlier versions or something.. and they talk using terms that mean nothing to me.

Any advice?

Thanks

Bryan

I use UI-View and am really impressed with it. I have run it on Win98, 2000 and XP with no problem. There is a 16 bit shareware version so you can get a feel for it, but for $15 it is well worth the purchase of the 32 bit version.

Folks,

When posting a followup message, please include only the portion of the previous message(s) necessary to establish the context for your new comments. It's really hard on us digest readers to have to wade through all the included text to find new text when the ratio of old-to-new-content is eight to one (the approximate ratio for digest #304, received today).

Thanks!

761. [APRS]Basic setting for Standalone APRS DIGI and WIDE Digi

Yahoo group: APRS (1998 — 2006)
Date: 2003-05-11 04:11:06 UTC
From: Tom Tishken KD4WOV(laptop)
Topic: 755 Message: 761

Hello,
I am in the process of setting up a few KPC3 and KPC3+ as standalone digi's and a Wide area Digi for our county. I would like some advice on basic setting for each as a stand alone node/digi.

Our situation here is: we Have 2 wide digi's both over 70 air miles from the center of our county. I am looking to install a Wide digi and several "relay" digi's to give our county some APRS coverage. The center of the county is where most of the population is. So my goal is a "wide" Digi some where near the center of the county and several "relay" (i.e.. non Wide area digi's to help cover our county). To give an idea of how poor our aprs digi is, I tried a 7 Db gain antenna at 50' and 175 watts and was only 20% effective at getting into the 2 "wide" area digi's. mostly this is due to hidden transmitter syndrome. the WIDE digi to the south is near Orlando and Orlando is separated from us by a 300' ridge, so we do not hear much traffic directly for Orlando, but the Orlando stations have the advantage of only being 15 to 20 miles from the WIDE digi. Same situation to the north with Ocala and Gainesville.

That is why we are looking at putting up a wide digi and several relay nodes, several people including myself have become very frustrated with trying to get into the Wide digi's from our locations. In order for aprs to grow in our county we are looking at these nodes to give us county coverage and possibly a IGATE later on.

Tom:
I'm verry interested to know what county you are in. I moved from Orlando to Citrus County. I'm all alone here. The best path seems to be to Tampa area and then to Orlando. However if you were in Sumpter county (best for me) or even Lake that would help me alot. Altitude is your friend. It is that big mound of sand that has all of us buffalo'ed. Good luck, i'm sure you will get some good help. I run D700's here.

In order to help reduce the "hidden transmitter" problem, you should make sure all the nodes you install respond to both RELAY and WIDE.

767. Quadratic equation help please

Yahoo group: APRS (1998 — 2006)
Date: 2003-05-14 02:15:24 UTC
From: surbahars
Topic: 767 Message: 767

I ordered a MIM, still waiting for it, but wanting to get ready.

It allows me to send telemetry data via packet. APRS and temperature and the like. There is a quadratic equation used to figure out the "real" value. For example: If you connected a thermistor and got a reading of 156 when it was 48 degrees you would use the following equation to determine temperature for any output from the machine.

Final value = A*X^2 + B*X + C Where X is the M.I.M transmitted value

Now I NEVER have done quadratic equations.. so I have no idea how to "solve" this. Anyone able to offer me help on this. I am at an 8th grade level on math these days... at best.

Thanks

The quadratic equation solves a second order polynomial equation with a single variable (x) -

x = [-b +/- sqrt (b*2 - 4ac)] / 2a

Let me try this again and see if this note shows up.

If I somehow missed something then disregard this note.

Unless you know what the constants A, B, and C are, you still won't get and answer. Do you know those values?

You are not solving for x in this case if I read what you stated correctly. Your answer is going to be given to you directly by plugging the numbers into the equation. This is based upon what you have said. X is the value that the M.I.M. transmits. Someone either has to tell you what the constants A,B, and C, are or you need three answers for this equation with the x values. Then you can solve for three equations with three unknowns. The proper way to implement this is probably going to be to create a lookup table rather than to try and calculate the answer on the fly. That is just my opinion, depending on how much memory you have and how much horsepower the processor has you are using, you may decide to do it differently.

If you need any help let me know. I'll do what I can.

Hello Brian,

How does this clear anything up?

Unless you know what the constants A, B, and C are, you still won't get and answer. Do you know those values?

You are not solving for x in this case. Your answer is going to be given to you directly by plugging into the equation. This is based upon what you have said. X is the value that the M.I.M. transmitted value. Someone either has to tell you what the constants A,B, and C, are or you need three answers for this equation with the x values. Then you can solve for three equations with 3 unknowns to figure out A, B, and C. An easier way to do this may be (if the readings are linear) to just graph them and use a lookup table to report the results rather than to calculate them.

If any of my assumptions are correct and I can be of help let me know.

772. Re: [APRS] Re: Quadratic equation help please/ balloon telemetry

Yahoo group: APRS (1998 — 2006)
Date: 2003-05-14 17:05:02 UTC
From: Bryan Lowe
Topic: 767 Message: 772

Thanks. The three variables were messing me up.. still are.. but I will think on this some more.

First off... there is a chance the MIM may no longer be available... so skip to the end for an alternative.

Here is some background...

TELEMETRY EQUATIONS: The real beauty of the APRS telemetry system is that you are not limited to specific calibrations as used above. APRS can display any other telemetry values acording to any specific quadratic telemetry equation. For the ultimate in flexibility, APRS
can receive on-air packets to define the Telemetry labels, units, and equations. Thus it does not need to be progammed for each application. These paramaters may be transmitted to all APRS stations live via four one-line BULLETINS. The first one defines the telemetry labels, the second
defines the units, the third defines the telemetry equations, and the forth defines the project name and digital bit definitions.
LIST-TELEMETRY: To see telemetry data in APRSdos, hit the LIST-TELEMETRY
command. Hitting this command causes APRS to scan the TRAFFIC page looking for telemetry equations, and then to scan the LIST-LOG page for any TELEMETRY values. The TELEMETRY samples are saved in the normal LOG files. A sketch of the APRS telemetry display is shown below:
APRS TELEMETRY FOR XYZ BALLOON LAUNCH
SER TIME Battery AirTemp BTemp Pres Altud Camra Par Sun 10m ATV 5th 6th
NUM volts deg.F deg.F Mbars K ft BIT BIT BIT BIT BIT BIT BIT
--- ---- -------- ------- ----- ----- ----- ----- --- --- --- --- --- ---
101 1215 12.8 86 85 999 0 ... ...
104 1218 12.4 84 80 980 4000 clik ... on on hi ... ...
105 1219 12.3 80 76 900 8000 ... ... on hi ... ...
106 1220 12.1 75 70 850 16000 ... ... on on ... ...
107 1221 12.0 70 65 800 32000 clik ... ...
108 1222 12.0 65 60 730 64000 ... ... on ... hi ... ...
To configure all APRS stations to properly decode the telemetry from a M.I.M module, one station transmits the proper parameter definition packets TO the CALLSIGN of the M.I.M module. For example of N3MIM's MIM:
To N3MIM:PARM.Battery,BTemp,AirTemp,Pres,Altude,Camra,Chute,Sun,10m,ATV
To N3MIM:UNIT.Volts,deg.F,deg.F,Mbar,Kfeet,Clik,OPEN!,on,on,high
To N3MIM:EQNS.0,2.6,0,0,.53,-32,3,4.39,49,-32,3,18,1,2,3
To N3MIM:BITS.10110101,PROJECT TITLE...
The PARM format specifies the name of each of the 13 parameters. The UNIT format specifies what units are to be displayed, and what label is associated with the digital condition. The BITS format specifies whether a 1 or 0 indicates the indicated label and also the project Title. The EQNS format has three coeficients for each of the five analog channels. Final value = A*X^2 + B*X + C Where X is the M.I.M transmitted value
FORMAL SPECIFICATION: The specific format for the TITLE, PARM, UNIT, and EQNS message

packets are shown below. They are entered as messages to the address of the MIM module:

PARM.P1,P2,P3,P4,P5,B1,B2,B3,etcWhere Pn and Bn are the parameter namesUNIT,U1,U2,U3,U4,U5,L1,L2,L3,etcWhere Un are the units for analog ports and Ln are the labels for the bitsEQNS,A1,B1,C1,A2,B2,C2,A3,B3,C3,etc Where the An,Bn,Cn are the coeficients for each of the five analog channels,BITS.XXXXXXXX,Title-up-to-23-charsThe x's specify the state of the bits that match the BIT Labels.T#sss,111,222,333,444,555,xxxxxxxxThis is the on-air format for the UI packet, where sss is the serial number followed by the five 3 digit analog values and the eight binary values.

So...

you want to have the variables for the equation plugged in so others can read the data... and actually, so I can easily read the data at a glance.

However, revolting development of the day....

I just got word that Bob Bruninga no longer sells them in spite of the dozens of pages that advertise the product and give his address. He referred me to a Stanford link that does.. but it was bad. He says he checks his mail once a month and will return my check to me at that time. I could cancel my cashiers check and get a refund, but it costs me $12. He says he is too busy launching pcsat2 to get to my check. So...

all this may be academic. And I will be out some money. Oh well I guess. I certainly appreciate his work with the PCSATS.

I am working on APRS in a Bottle. I did discover some code online that is for a balloon project. I am learning Stamps.... and the documentation is for advanced readers only... but as I learn more this code may help me figure out an APRS telemetry unit with my stamp2.

Here is the link to the site.... though I would love to find something just a touch easier to start with...

http://www.ksu.edu/humec/knsp/asimov2.htm

I appreciate their willingness to share their info. A nice model for all of us.

I also bought a book called Stamp2 communications and control projects, and it has a chapter on a balloon telemetry system... but there the program is actually for a stamp 1 and wont work with stamp 2. it also sends the data in cw. It would have been a nice start.. a fun experiment.. but...

as a final side note...

The book comes with a disc that has all the stamp programs on it. Most have minor errors. The most common being incorrect comment code. That is easily fixed. But three of the programs have bad code that I can't figure out. Why do so many books on electronics have so many errors. It makes one rather cautious when it comes to building anything out of a magazine or book. Lots of money, lots of time, and it doesn't work due to errors in article or book. Grr.

Do you Yahoo!?
The New Yahoo! Search - Faster. Easier. Bingo.

From: n1xtk
Topic: 767 Message: 773

Not to pick nits but, A, B, and C, are constants, not variables.
Once you know what they are they don't change. Only x changes.

I think I understand what the MIM was doing but there is no point in
going into it since you don't think they are available. I also tried
to get a hold of Stanford several months ago by the web page and
also found I couldn't get them.

The basic stamp should allow you to do a lot of things fairly
easily. Let us know how you make out and if we can be of any help.

72/73,
Keith

774. NEED HELP

Yahoo group: APRS (1998 — 2006)
Date: 2003-05-14 14:00:09 UTC
From: TA2LE - HALUK YETKİN
Topic: 774 Message: 774

Hi all,

We are operating igate called ta2ki-2 with uiview32 1.93.

We want to setup new digipeater tnc2 with uidigi1.8 installed.

For that digi we want to setup callsign like ta2ki-4 but when we set ta2ki-4 for digi. it is not digipeat message from ta2ki-2. How can fix this problem.

Thanks TA2LE- HALUK

hi all,
I am a new ham, kc8wmi, looking to get into APRS. unfortuantly I have bought one of the "smart trackers" that I now know to be a stolen idea from N6BG. Any ways, i have that and my tranciever setup. I guess all i need to know is which gps seems to be good (and cheap!) and some help with settings on this tracker.
One thing i cannot figure out is what the "Path" should be. It has two fields, one for a MIC-E path and the other to be repeated by digipeters.
any response is welcome!
thanks

Oh Great Chris, I was rooting thru the staples stores and picked up 3 serial docking stns for $6us ea, and just about every store has them to clearout. (if only ac powersupplies where as plenty full) I also found out the software from Hp supports the serial as well as the usb.

Recently, at a hamfest, the fugawi technician was there demo'ing their software and I'm convinced I got the right pda in a jornada. I made a major investment and upgraded my ram to 256meg and everything flys now

Last week I did a search for another group (APRS in a bottle). On E-bay I found 18 GPS receivers, new in the box from different sellers. Motorola, Garmin, etc. My criteria for the search was price between 2 and 10 dollars. So yes, GPS for under $10, most any model, all the bells and whistles... Antennas run between 5 and 10 dollars, there are many more of these than GPS receivers, usually you can find between fifty and one hundred at any given time. Had I known this I would not have blown $15 each on three Motorola OnCore GPSs a few months back from BM Micro.

Kurt,

I hate to be a skeptic, but a quick ebay search reveals nothing that fits your criteria. A starting bid of $10 does not mean that it will meet the reserve.

Please post a link to one of these $10 new, in the box, GPSs with all the bells and whistles.

A GPS is a GPS, the difference is the bells and whistles. They will all ultimately do the exact same thing and no less. They will tell you where you are. As for specifications, you will have to read what the seller has to say about each one, or make note of the various models, then look on the manufacturers website. There are also several systems to choose from. LORAN rarely costs more than $1 due to age, size of equipment and the fact you can get a truckload free for the asking. The Soviets have their own system running at 149.995 MHz, these receivers too cost only about a dollar. I have a very nice unit from a Soviet ship. It's huge, the only thing I can use it for is a very accurate clock in the shop. I think the Soviet model also uses a signal around 403, 406 or 417 MHz for differential input.

I've never heard of it? How do they differ from my Garmin 3Plus? What applications can they be used for? I'm always looking for new technology.

> Last week I did a search for another group (APRS in a bottle). On E-bay I found 18 GPS receivers, new in the box from different sellers. Motorola, Garmin, etc. My criteria for the search was price between 2 and 10 dollars. So yes, GPS for under $10, most any model, all the bells and whistles... Antennas run between 5 and 10 dollars, there are many more of these than GPS receivers, usually you can find between fifty and one hundred at any given time. Had I known this I would not have blown $15 each on three Motorola OnCore GPSs a few months back from BM Micro.

Kurt,

I hate to be a skeptic, but a quick ebay search reveals nothing that
fits your criteria. A starting bid of $10 does not mean that it
will meet the reserve.

Please post a link to one of these $10 new, in the box, GPSs with
all the bells and whistles.

Not the whole story. GPSs differ greatly in their sensitivity, speed, and whether they can output NEMA.

Hi...

GPS for under 10 bucks! We should be so lucky!... In the UK, you'd be lucky to find one for under 50 quid (UK pounds)... Whatever the starting price on EBay....

The Russians use a similar frequency to the US satellites, 1.5 or 1.6GHz I think, and a different coding system, that makes all but the few "professional" systems able to use both. Someone once told me that Phillips made one that would, but I cannot confirm..

Don't know what the 400MHz signal would be, differential beacons perhaps (The US system I believe, and certainly the European Differential beacons are in the marine band, below 1MHz...)

The reason Loran is "cheap", is that it is not used now, or is being phased out, so even if you got something that worked, it wont soon!... Likewise other "Parabolic" surface based (non satellite) systems.

Also, be careful with NEMA spec's, there are at least two versions, with different "sentence" specifications. Do a web search on "NEMA", and you'll find stacks of info detailing all the different sentences, many duplicate each other in some way or other...

In any case, have fun! There is lots to learn!.....

Dave G8KBV.

PS: Anyone know what the ext ant mini co-ax connector is, on a Magellan GPS3000? It (looks like a micro-mini TNC, if such a thing exists) Or, the whereabouts of any external power/data/antenna packs... Would save me much faffing about building something.... 73...

Hello, this past weekend i went to the hamvention and bought a new Th-D7AG to play with.. So far its pretty nice! (at least with all the activity in dayton). I come home and there is no activity...I look on the map and its pretty blank but for 30+ miles away..

I have talked to some locals and one is wanting to change an old packet node into an APRS Digi.. How would i go about setting up an igate for us to use to get out that way?

Thanks a lot

Dear Robert:

First congratulations on your purchase and welcome to APRS ! I received my D7 for Xmas last year and love it ! Here in rural NW TN (EM56), I thought activity would be pretty slim. Actually it is quite active. First realize that the antenna that comes with the D7 is little more than a leaky dummy load ! If you have the where-with-all to set up a base station in your shack with a gain antenna (something like a Diamond X50 or X500) you will then be able to hear the APRS packets. This requires an old TNC and a 2M FM rig and your computer. I use UI-View32 (downloaded over internet) in conjunction with Tow Software's Precision Mapping v.5. Then setup UI-View to digipeat - then everything you hear will be repeated. NOW you can use the D7 TNC to hear the digipeats ! This works great. There are lots of details - that's where the devil is !! Don't hesitate to ask questions.

I use a Magellan Meridian GPS to interface to the D7 and the packets show up on the GPS screen as waypoints. Very cool ! I have not as yet interfaced a laptop or PocketPC to the D7 yet, with the GPS. There are lots of possibilities as far as mobile tracking and messaging.

Yea.. I am antenna restricted but i figured for now a RX igate (if there be a beast) would be sufficient for getting packets igated out of this "hole" as i like to call it lol..

I would definately hate myself if we dont get some kind of APRS going around here though hahaha... I got that D7 for 305 before taxes (324.82) afterwords... i love it so far besides ive heard 2 stations (traveling) since ive been home this week from dayton haha..

Ill definately have to get me another tnc some day for this home station (i like the idea for portable operation with the palm + d7 + gps.. my good friend KE4NYV (Jason www.ke4nyv.com) helped me along in getting into aprs.. hes a member of the development group for the "HamHud(Heads up display)"..very nice product that i want to put together when i get a vehicle.. then the D7 for portable operation.. its a great "mode" if you will.

Well thanks guys i guess we will just have to see what goes on after we get the digi up.. maybe our packets will get igated out 30 miles away lol.. that would be handy! :)

Robert:

If you can get your hand on about 60 inches of 300-ohm TV twinlead, you can make a 2M (actually 2M/440) J-pole. Hang it up high (even with fishing line) and let the good times roll. Also great to have these 'roll-up' antennas as part of your emergency 'go-bag'. You can get KPC-3's on eBay for a song. Oh, and actually, gating is a term used only for cross band digipeating now - from HF to VHF. "Relaying" is the term for VHF to VHF digipeating. It has to do with the unproto commands to set this up. If you get a HF/VHF TNC ie. KAM Plus, I'll show you how to set that up. You will need two rigs for this - one VHF, one HF (30M). I haven't gotten it to work with crossband repeating on a single rig like a FT-847 ;=)

The only TNC that will act as a standalone APRS digi
is the KPC-3 PLUS, otherwisw you need some sort of
digined software running on somekind of computer.
pocketaprs.com is working on a palm pilot digi
controller that will work with older TNC's.

Actually i have 100ft of twinlead haha.. I dont like making one without an swr meter.. hrmmmm oh well

I do have two hf rigs (no general yet) the Icom 718 i just bought a few months ago and the TS-520s that i bought a little while longer... So i guess i need to set up a "relay" VHF to VHF?.. I mean i dont know how you would take the signals in from the local digi to the main aprs data place? I dont know how this goes down... i figured you could get it working by sending raw packets or something to a server located somewhere to do with aprs on a certain port etc..

Any further help would be appreciated

Thanks a lot

Actually i was aware of an MFJ TNC that could act as a stand alone digi..
but they are setting up the digipeater.. all i wanted to do was gate out the
packets at least.. and back in would be cool also..

The only TNC that will act as a standalone APRS digi
is the KPC-3 PLUS, otherwisw you need some sort of
digined software running on somekind of computer.
pocketaprs.com is working on a palm pilot digi
controller that will work with older TNC's.

Tyson may be able to correct me here, but I believe ANY TNC can be made to act as a digipeater but with software ie. attached to a computer. Stand-alone digipeaters (or beacons) take more firmware - like the one in your D7 - and don't need an attached computer. Tyson, correct me if I'm in error here - it's been awhile since I looked this over ;=)

From: KC8TAD
Topic: 790 Message: 800

The 718 is an HF rig... lol but i have a mobile i use on the RS-35A and the mobile is an FT-2400.. but i could manage the jpole adventually but i will have to dig up an swr meter from someone if i can.. But i know i still wont hear aprs packets with that .. i will have to wait until that APRS digi goes up (soon i hope!!)

Thanks

802. RE: [APRS] New to APRS

Yahoo group: APRS (1998 — 2006)
Date: 2003-05-22 00:40:13 UTC
From: KC8TAD
Topic: 790 Message: 802

It is hooked up that way right now to the 5/8 wave antenna (even if it is outside) haha

It is still quiet... i have gotten local aprs packets but thats by people traveling through with (i guess) "realy" in there path....im learning still! =X hehe

I bought the SMA connector so i could hook up the antenna for something like this....

Jamie,

Is this true? Can a Meridian actually display the APRS stations as waypoints? Does it show the call letters as well? The major reason I bought a Garmin GPS-V is that it can do this and I thought the Magellan (which I much preferred because it can take memory cards) couldn't.

Jamie,

Is this true? Can a Meridian actually display the APRS stations as
waypoints? Does it show the call letters as well? The major reason I
bought a Garmin GPS-V is that it can do this and I thought the Magellan
(which I much preferred because it can take memory cards) couldn't.

807. Hospital Based APRS stations ?

Yahoo group: APRS (1998 — 2006)
Date: 2003-05-23 00:43:37 UTC
From: Andrew J O'Brien
Topic: 807 Message: 807

I wonder if there are any APRS stations out there permanently based at hospitals? I am doing a presentation next month to senior hospital officials about emergency communications and plan to show APRS. I think it would be fun to not only show a map of hospital stations but to perhaps actually arrange a message via APRS from hospital to hospital.

Looking good Jamie, but i have some questions.

Where did you connect the GPS, in the GPS-connector or the PC-connector of the D-7?

How did you setup the D-7 and the GPS?

Do you know if this work with all other Magellan Meridian GPS´s or just the Platinum?
I know there are some difference between the models.

Hi Bjorn:

Definitely the GPS connector. I pretty much emulated Matt on his web site. Just remember red wire - RXD - ring ! All R's ! After that the most important thing was to get the baud rate matched up between the two. I also activated NMEA on the D7 - not sure which is best, just pick one. Suddenly, everything starts to work. I'm going to fashion a couple of data cables this weekend to get away from that bulky double-connector in the middle.

Hey guys, I know what Rob is getting at:

They basically have an old node set up and they want to get it doing BASIC digipeating. They can do this by setting it up as a WIDE digi with the callsign as the main call and WIDE as the ALIAS (MY ALIAS). This will get them digi'ing WIDE pathed packets untill they can get a laptop or somthing to run DigiNed or somthing similar. I'm actually working on a Windows based smart digi program as we speak. I'm learning about builing KISS frames, been interesting.

Basically once they get the digi going, Rob might start seeing more activty, but for now he can get the gate working to GATE OUT packets he gets FROM the server. This along with the WIDE digi they are putting up should spawn some new activity in the area. Basically he needs an extra TNC he can dedicate to the gate. Once they get more local activty the gate will serve as an incomming gate to the server. He's on the right track.

Hi All...

Anyone know what the external antenna connector is, in the battery compartment of a Magellan GPS3000? (Handneld unit) It looks like a tiny "TNC", but I'm not aware of the existance of them...

I have ID'd the NEMA out connector, and DC in (6V) in of course, but not the antenna socket.

Or, anyone know where I can get an external Power, Data, Antenna module? (Not made any more, and no, there are not any on eBay!)

Dave G8KBV.

If I remember correctly it is a proprietary connection, and you will need the power/data/antenna module and the low-profile external antenna for Magellan.

HTH!

I have tossed around that concept and came up with a
few ideas ... I'm now looking for a tiny trac to
experiment with ..... anyone have one around that
they would like to sell? And another GPS unit.

Probably using a HT, an Active GPS antenna and a
Oncore GPS unit as well as a Tiny Trac ... stuffed
into one of those Doggie Backpacks .... then having it
TX every 30 seconds to give good tracking resilution.

hummmm callsigns ...K9DOG and W9CAT (Wisker9CAT);-)
actually probably would be N9NLU-8(O) ...Otis... and
N9NLU-8(B) ... Bocephus ...

Greetings Andy,

I'm in the proces here of collecting and fabricating
the needed hardware for such an 'animal' <grin>...

Got my hands on a /\/\ Oncore GPS unit, and a DJ-C1 HT.
Still need to get the funds together for the TinyTrak,
a PwrSupply/interface board for the Oncore, fabricate
some kind of stable mount for the HT, and design the
ballistic nylon back-pack to carry it on the K9's back.

Plan on having a row of either C or D cells down each
side for power, or two of those long CamCorder packs.
That would provide 2800 mAh @ 12v. and be rechargable.

The DJ-C* series is very interesting, but needs to have
some aftermarket accessories built for it, to be truly
useful. If anyone has the schematic for this unit, I'd
really like a copy.

What would be 'keen', would be if some company would step
up with a 'bare bones' xcvr (without the LCD, keypad, etc)
for public consumption, that was perhaps programmed by use
of DIP switches to select frequency, etc... It OUGHT to be
possible (what with recent SMT design) to produce something
along these lines in a package about the size of a match pad.

818. GPS Donut (Display Less) for APRS

Yahoo group: APRS (1998 — 2006)
Date: 2003-05-25 19:13:13 UTC
From: Bill Reid- VE3VWD
Topic: 818 Message: 818

I picked up a TripNav TN-204 GPS -$120 USD tax incl(with no display) unit while in Dayton from the boys at Blue Hills Innovations (www.blue-hill-innovations.com). It has a PS2 male connector on it.

While at the Hamvention I also grabbed a keyboard extension cable. This gave me my female connector on one end and I cut the other off to run to a DB9 female , put a 7805 regulator IC in the DB9 case and ran 12 volts in from an old cell phone 12 volt adapter which was putting out about 8.5vdc.

I now have GPS NMEA input for my APRS and my Garmin Legend can go back to being a hand held !

The unit has a magnet in it but I mounted it in my back side window of my van.

This unit locks very fast and recovers very fast. It is water proof but I prefer to keep it inside the vehicle. I'm very impressed with it so far.

The unit sells from Rayming with adapters for PDA's for $139 USD but mine did not include any other than the unit it self. Cost me $2.50 for PS2 extension cable.

In the case of a cat or dog, the assumption is that you'd be tracking it in your neighborhood. Therefore, you'd need pretty low power. Maybe a simple transmitter based around the Motorola MC2833 would do the trick?

There are a variety of small GPS receivers and APRS transmit-only TNC's, but you're still probably looking at $150 or so for something small enough that you'd actually want to put it on your pet.

Maybe it's more practical to just put a small transmitter on your pet and do some good old fashioned DF to find it? However, this does involve stepping away from your computer for a moment ;)

I thought about using a PIC device a while back when I picked up my GPS V. It seams to me that sending objects to any of the Garmin GPS's that support them would be easy enough. Garmin has a protocol document on their site at http://www.garmin.com/support/commProtocol.html. It appears that you would have to communicate with the Garmin in "Garmin" mode as apposed to "NMEA" mode, so the PIC device would have to build the NMEA sentences or APRS packet to be broadcast.

Bernie, K3BAZ

Help!

I'm currently running APRS+SA in conjunction with my D700, which has had some problems lately. A couple of days ago, I did a complete reset on the D700, and have managed to get everything back where I had it, except for one strange issue. Running APRS+SA, I keep getting two series of maps; one is labeled KG4RKN+A and the other is MAP4+A. I'd rather have the 4+A map, as it shows the two station I want to track (my van and my balloon); what setting(s) do I change to keep the system from defaulting back to the KG4RKN+A map?

Thanks in advance. Hope someone can help me figure this one out. I'm not exactly proficient at this yet.....

837. Configuration Help!!!

Yahoo group: APRS (1998 — 2006)
Date: 2003-06-23 01:38:53 UTC
From: Jim
Topic: 837 Message: 837

I am trying to get WinAPRS up and running for a FD demo station, so far without any luck. I have the VHF rig set on 144.39 and it is receiving packets via a Kantronics Packet Communicator 3. If I use a generic terminal emulation program (like the Hyperterminal app that comes with Windows) I can see all the packet traffic. I can capture the traffic and store it in "Startup.txt" so that when I restart WinAPRS, all those stations pop up on the map.

The only problem I have is that I cannot flow the data stream into WinAPRS. I have set up the station information, configured the serial port to COM4, 9600,8,1,N - verified that the TNC is configured for 9600,8,1,N, but when I open the TNC, no packet info appears in the status bar and no new stations are shown in the list display. The TNC is initialized with the WinAPRS suggested setup commands, and I can verify that it is not runnning in KISS or Host mode. I even did a hardware reset to make sure it was in factory condition. I can press "F2" to report my position, and that lights up the TNC and keys transmit on the rig. So close and yet so far.

I suspect the problem is with the serial interface on the Rx side. Since I have a newer computer without a DB style serial port, I have to use a USB/Serial converter. I have done this with several pieces of legacy hardware, and all work just fine with the converter. Obviously from the above info, you can guess that the adapter is installed on COM4. The version I am using in WinAPRS 2.7.2, just download this weekend off TAPR.ORG.

I know the COM port is configured properly since it is passing data to Hyperterminal with the settings shown above. The question is how do I get WinAPRS to read the data coming into the COM port? Anybody ever have this problem? It seems really strange that I could use this setup with one application but not another.

73,
Jim

Phil,

I read your previous post and would like to ask a question of
you....I am receiveing data packs over a wireless ip network. ie
the car has a computer with a modem and is attached to the wireless
network. The modem in the vehicle is GPS equipped. The GPS data is
sent to the office via the wireless ip network and the data is then
sent to my pc on my desk. I am trying to locate a software or a
solution that will look at the data stream coming into my computer
on the LAN connection and plot that vehicle on my map on my pc. I am
running windows 2000 pro.

Thnaks for any help or advide you may be able to give,,,

841. RE: [APRS] USB/RS232 Configuration Help!!!

Yahoo group: APRS (1998 — 2006)
Date: 2003-06-23 09:52:32 UTC
From: Dave Baxter
Topic: 841 Message: 841

Hi...

From personal experience with USB/RS232 converters, some programs don't like them to be configured as COM3 or 4. Something to do with Interrupts... Remember Com1 and 3 share an interrupt, as do COM2 and 4. If you have another device as COM2 (an IRDA port?) try disabling that in Control Panel, and see if WinAPRS is then happy with COM4...

If you can configure the USB device to appear as COM5 or higher (many can support up to COM256!) !AND! WinAPRS can support COM5 or higher, then you might be on to a better chance...

Despite my hate of Hyperterm, it does seem to fully support the "higher" com ports, so usually shows that things are working, but... Many other comm's programs do not, and cannot as their IO routines are not written that way.

Also, the way USB works, it can split up the serial data stream into buffered chunks, so sometimes the last few bytes don't arrive at the Windows application for a period of time. Check the config of the USB device drivers, and take a look at it's manual, or makers website.

Much to my surprise and delight, we recently found that a 16 bit test program (used for EMC testing) that we knew was supposed to work with up to COM12 (but had never tried) quite happily used the "fake" COM5 on a WinXP laptop, created by the driver for a FTDI USB/RS232 converter. So it can be done.

When you say you hit "F2" in WinAPRS, have you verified that it actually sends what it's supposed to... However, that is not a 100% test of course, as I have seen some programs happy to send, but not RX, and the other way round.... (using USB/RS232 adapters)

Fiddling with the USB devices driver settings, disabling any buffers, setting/clearing handshake lines etc may help, or hinder....

Be interested to hear what the fix is, if any, when it's found...

73. Dave G8KBV.

That it works with hyperterm says your physical hook up is ok. I encountered this problem with an aea pk12. I had to go into the command prompt and turn on the "BBSMSGS" now it shows up all the beacons...
I pulled that sentence from this reflector dated January 20th. Someone here helped me find it.
Good luck.

Subject: [APRS] Configuration Help!!!

I am trying to get WinAPRS up and running for a FD demo station, so far without any luck. I have the VHF rig set on 144.39 and it is receiving packets via a Kantronics Packet Communicator 3. If I use a generic terminal emulation program (like the Hyperterminal app that comes with Windows) I can see all the packet traffic. I can capture the traffic and store it in "Startup.txt" so that when I restart WinAPRS, all those stations pop up on the map.

The only problem I have is that I cannot flow the data stream into WinAPRS. I have set up the station information, configured the serial port to COM4, 9600,8,1,N - verified that the TNC is configured for 9600,8,1,N, but when I open the TNC, no packet info appears in the status bar and no new stations are shown in the list display. The TNC is initialized with the WinAPRS suggested setup commands, and I can verify that it is not runnning in KISS or Host mode. I even did a hardware reset to make sure it was in factory condition. I can press "F2" to report my position, and that lights up the TNC and keys transmit on the rig. So close and yet so far.

I suspect the problem is with the serial interface on the Rx side. Since I have a newer computer without a DB style serial port, I have to use a USB/Serial converter. I have done this with several pieces of legacy hardware, and all work just fine with the converter. Obviously from the above info, you can guess that the adapter is installed on COM4. The version I am using in WinAPRS 2.7.2, just download this weekend off TAPR.ORG.

I know the COM port is configured properly since it is passing data to Hyperterminal with the settings shown above. The question is how do I get WinAPRS to read the data coming into the COM port? Anybody ever have this problem? It seems really strange that I could use this setup with one application but not another.

73,
Jim

Do a full reset on the tnc. If the sentence is not right then winaprs will not decode it. If i use other programs with the tnc it changes some settings on the tnc then it works like yours.

TM-D700 & TH-D7A(G)

I have the listed rigs in excellent condition. The H/T comes with the PB-38 & PB-39 batteries. Both radios will be shipped in original boxes with original manuals. Looking to trade both for a Drake R8B in as new condition, or HF rig (i.e. FT-897, Icom 7060MKIIG, IC-746...no QRP please) general coverage transceiver. Also have an Alpha-Delta VRC active speaker (in as new condition)that I can throw into the trade if necessary.

Additionally, will sell both for $825 + shipping

Please e-mail off list if interested & thank you.

Dave, the Hyperterm supplied with Windows 98 does not support ports
higher than COM4. Even the HyperTerminal Personal Edition that is
supposed to be an improved terminal emulator
(http://www.hilgraeve.com) does not support higher COM ports.
I have an IBM laptop with an integral modem at COM1, infrared at COM4
and due to the interrupt sharing, my first serial port is
automatically defined as COM5. To use the serial port, I have to
disable the infrared and reboot (and wait, wait, wait.....), in order
to make the port autoconfigure as COM2.
How did you manage to make it work?
If you know of any other terminal emulator that can see COM5, please
let me know.

Thank you

Hi...

This system, Win 2000 Pro, (SP2) and I was using a FTDI USB/RS232 device that set itself up (the first time) as COM7:

I initially used the freebie Hyperterm that came with the system, creaky but it did work...

I just loaded up V6.3 (the freebie "personal" download from Hilgreave) and that certainly supports COM5:.... (On this Win2000 system anyway!) Though I don't have a USB/RS232 device to try at this time...

Maybe there are differences (almost certainly I'd guess) in how the different versions of Windows handles things behind the scenes...

The application I was wanting to use, is a Win16 (Win3.11) program, and even that ran OK on hear, with the device as COM5: (or COM7:) talking to a remote measuring probe via a self powered RS232/Fibre interface itself powered from the USB/RS232 device... (That 16 bit program supports up to COM12 if needed!)

Check out http://www.ftdichip.com/ for more info re USB/RS232 (and other ports) and the system requirements etc... There is an awful lot of information to plough through, but it's very instructive to say the least....

As an aside... Even as a total anti Microsoft freak, and a Windows hater (I HAVE to use it, no choice hear) It has to be said, that Windows 2000 Professional, is the most stable of all that I have personally used. I have a Win16 screen saver (Catz), and the (Monty) Pythonizer is running (another Win16 program) And 99.9% of the time, no problems or conflicts occur... Usually if there is a problem, then Task Manager shows "Explorer" as the culprit!

I have also, a whole hose of other Win16 and DOS utilities, and all work fine. But beware! Win2000 has a habit of powering off the IO ports (COM and LPT) when in DOS mode, unless you fiddle with the registry.. Not for the faint of heart!

The "Office 2000" suite of programs though (Word, Excel, Outlook etc) are a dog's dinner by comparison.

Win XP Pro also seems quite good, once you have it set up properly. We had the same Win16 measure and test program and USB/RS232 running on an XP laptop just fine, once we had proved the software on this 2000 system...

But as in all these things, that is where the skill and knowledge comes in. I have to say, I did not build or set up this (or the XP) system, that's

probably why it works so well!!!!

Hope this helps....

Dave G8KBV

Dave, I found a note in the Hilgraeve Knowledge Base.
That is really strange.....
Anyway, all this is not related to the APRS subject, so if you have
any additional info, please use my personal email.
Thanks.

Comm Ports Above COM4

HyperTerminal and HyperTerminal Private Edition do not support any
direct connections beyond COM4. If you need to access ports 5+, you
will need to use an alternative software program, such as our
XXXXXXXXXXX. XXXXXXXXXX does not limit the port selection to the
standard ports, COM1 through COM4.

(I replaced the program name with XXXXXXX. They do not need my
advertisement.)

Are you SURE that "due to the interrupt sharing, my first serial port is automatically defined as COM5."?

First off I would look in BIOS to see if the internal modem can be set to 3e8, IRQ5 which is COM3 but a different than normal IRQ.

Second, leave the infrared on COM4 which is 2e8 but remember that infrared uses TWO addresses: the physical one on COM4 and the virtual port set up by the MSIRDA2.0 software. Remember something about "providing application support on COMx and LPTx"?

What happens is the driver looks at the physical port and provides infrared ports- so it MAY be taking COM2 and making it available. These can be changed to higher in the Infrared applet in the control panel

and the bottom line is you may get COM1 and/or COM2 back!

Thanks

850. Configuration Help - Part 2

Yahoo group: APRS (1998 — 2006)
Date: 2003-06-23 22:28:12 UTC
From: Jim
Topic: 850 Message: 850

I finally gave up after trying all your helpful suggestions. I decided that I had devoted way too many hours to this project, and borrowed the XYL's laptop which is a Win 98 machine with a "real" serial port. Copied over a few files, and bingo.

The only thing different between the two machines is the USB vs DB-9 serial connection. Despite a number of registry hacks to force the USB adapter onto COM1 and COM2, I was never able to get WinAPRS to talk to the TNC the way it is supposed to. I found another thread somewhere on the Internet (don't ya love Google?) that said the compiler used to create WinAPRS did not recognize COM3 or COM4, which would explain my problem. So, until the next version of WinAPRS comes out, I think I am stuck with the older laptop.

If anybody comes up with a solution, by all means pass it on. I spend enough years trouble shooting serial connections back in the dark days of Hayes modems (I know the extended AT command set very well!) to know that sometimes you cannot do thing on COM3/4 even though you are supposed to be able to. Thanks to all for some helpful ideas.

73,
Jim

851. Configuration Help - Part 2

Yahoo group: APRS (1998 — 2006)
Date: 2003-06-23 15:03:09 UTC
From: Jim
Topic: 850 Message: 851

Thanks for all the friendly advice. Here is what I have learned since my last post:

1. COM port seems to make no difference. At Dave's suggestion I tried using the "brute force" approach to force the USB adapter only various COM ports numbered 1 to 5 - this required a simple registry hack. This did not cause any conflicts, since I have no competing devices except a DSP modem on COM3 that was inactive. I was able to open APRS each time with the port specified (even tried opening on COM2 when configured for COM4, and COM1/COM3 to see if the shared interupt would let me do it - and that works sort of, WinAPRS lets me open the TNC).

2. I have done a full reset several times. That seems to have no affect. When I say full reset, I have tried both the software reset and the hardware procedure that takes the box back to factory defaults.

3. I think the TNC end is working fine. Last night before I went to bed, I loaded up Hyperterminal and let it run all night. I captured several thousand lines to a "starup.txt" file, which WinAPRS loaded with no problem when I started it up this morning. So, I think the packet syntax coming out of the TNC is OK.

This has got to be something in the way WinAPRS talks to Windows since the COM port seems to have the right info. Any other thoughts? I thought I was done debugging serial connections from the command line interface when I threw my Hayes modem away many years ago.

Thanks for the help, it is appreciated.

73,
Jim

From: Jim
Topic: 837 Message: 852

Thanks for the suggestions, but I found another site on the web that said the compiler used to create WinAPRS did not recognize anything above COM2 as a valid port (to avoid interupt collisions?). Bottom line, no amount of registry hacking or moving items around on the COM ports would led me get my USB onto COM2 where it needed to go.

My solution was to install Xastir. Not exactly your typical Windows installation, but since I used to program computers back in the dark ages where you had to know your way around compilers, linkage editors, and command line interfaces it was not too painful. A very nice program and very feature rich; I suggest it if you are the type that liked to build Heathkits.

853. Simple Homebrew HF APRS transmitter design?

Hello all:

Does anyone know of a simple SSB crystal controlled transmitter design suitable for HF packet? I envision using it with a TNC for a tracker for backpacking, where VHF is not adequate. I'm in the process of learning code for just that reason.

I imagine it could be pretty simple if the VFO was eliminated and it was crystal driven.

A kit or schematic would be great, if anyone knows of one.

Thanks!

Jason

857. voice on 144.39 - bad form?

Yahoo group: APRS (1998 — 2006)
Date: 2003-07-02 17:48:09 UTC
From: Bob Heath
Topic: 857 Message: 857

I'm new to APRS and have a question about proper protocol.

My primary application for APRS is on my bicycle where I plan to use a handheld transceiver, tiny-track 3 and Garmin GPS3+ to send APRS packets. I also need to use the handheld for voice communication, so I'm thinking about ways to accomplish both with just a single handheld and antenna.

I'm aware of the mic-e, but I plan to operate in a wide variety of different areas where I can't count on a voice repeater being available to forward my APRS packets. Besides, that's a lot of extra hardware to carry on my bike. Heck, with just the handheld, I'll be lucky if I'm able to hit any APRS relay or wide digipeter at all much of the time.

So, what seems like the straight-forward obvious solution is to just do my voice commumication on 144.39. I wonder though if this would be considered rude by other APRS users. Anyone care to comment?

One other thought that occurred to me as I wrote this is that I myself may find it unacceptable to listen to voice on 144.39 because of the noise of incomming APRS packets. It seems like I could use a CTCSS tone to squelch those as long as I'm only interested in sending packets and not receiving them.

I'd be interested in any comments about the propriety of doing what I've suggested above as well as ideas for alternative approaches.

Thanks,
Bob KD7OHF

I think this would definitely be considered a problem by other users. Packet transmissions are very short, and a large number of them can fit into a small slice of time. Voice transmissions, however, are relatively speaking very long, and any voice transmissions you make will disrupt packet communications for the duration of your conversation. If someone did this more than once or twice in my area I'd definitely complain. On the other hand, if the area you'll be biking in has relatively little APRS activity, it might be that nobody would be bothered.

> with just the handheld, I'll be lucky if I'm able to hit any APRS relay or wide digipeater at all much of the time.

Depending on the areas you're talking about, I think you'll be surprised how many of your HT packets make it into the network. Conversely, if you're riding in an area where you'll be lucky to hit part of the APRS network anyway, why bother with the mobile APRS setup to begin with?

Since your HT (without MIC-E or some other method of automatically tagging your packets onto your voice transmissions) can't be doing packet and voice at the same time, can you just switch to another memory channel when you want to talk? If you mount the HT on a chest harness or forward on the bike, or use a speaker/mike with up/down channel/frequency buttons (there are plenty of them out there), you should be able to do this with no problem, as long as you remember to change back. You'd probably want a switch to cut off the packet TX line to the radio when you go to voice mode, too.

The easiest solution, of course, would be to just drop the $50 for an extra HT and be done with it. Or, if the party with whom you need to have voice communications is another biker or a sag wagon, pick up a pair of FRS radios for $20.

Hi .Pres
When I read your suggestion, I asked myself "How am I supposed to change the BIOS settings?" In every PC "compatible" that is easy, but on an IBM Thinkpad???? I have searched through the online documentation several times before, using the built-in search engine for the word "BIOS" but without any result. Then, I remembered one of my teacher's remarks, "RTFM" Read Those F... Manuals, at those times when manuals were only in printed form. I decided to go through the entire documentation this weekend. And voila, a section titled "PS2 commands" which I had always disregarded because I associated it with OS/2. Although the manual spends a couple of pages to describe how to turn on the power switch, there was not even a slight indication about the purpose of this section and of course, not even a single occurence of the word "BIOS".
Well, the commands:
PS2 IR ADDR 3
PS2 IR IRQ 5
PS2 IR COMMADDR 3E8
on a DOS prompt were all that was needed to set the infrared to COM3, IRQ 5, I/O 3E8 and relieve me from a two year burden of restarts!!!!!
In the default configuration, IRQ 4 was shared by the serial port and the infrared. Now, I have the internal modem on COM1, serial on COM2 and infrared support on COM4:. No need for ports higher than COM4 anymore.
Many, many thanks.....

Topic: 861 Message: 864

There's been lots of debate lately on the TAPR APRS SIG email list (http://www.tapr.org/cgi-bin/lyris.pl?site=tapr&enter=aprssig) about "Voice Alert."

The basic concept is that you can monitor and transmit voice on 144.39 using a PL of 100. If only people who are monitoring for audio transmit with a PL, then you'll only hear voice/date on your speaker within simplex range. This works fine if you're using a mobile tracker which isn't trying to receive packets, of course it messes with the "busy channel detect" feature that some mobile trackers have.

The advantages of it are that you hear a data burst when somebody is within simplex range also using "voice alert", so you know when there is somebody to talk to. Of course you should switch to a different channel for anything more than establishing initial contact. If you're running a special event that requires a combination of APRS and voice, you could also just use a different freq entirely... a simple digi could gate your packets over to 144.39 or to the internet.

join the list at the link above and search for voice alert to read some of the messages

I'm currently working on a UI packet based TNC for APRS. It gives send and recieve capability in a small package. I have a rough write-up on my website http://www.burrotech.net/hamradio/avrtnc.php including pictures of the working prototype. My plan is to produce a kit that would make it cheap and easy for new hams to get into packet radio/APRS, attract new people, as well as give current APRS users a customizable tnc for many different applications. I'm trying to gauge interest for the kits. If you are interested contact me at my yahoo account or the address on my webpage. I'm estimating the kit to be in the range of $70-80.

I have a Rockwell GPR-450 that contains a Rockwell MicroTracker GPS.
It works well with Street Atlas when I setup SA for Rockwell Binary
format. I would like to do a Microcontroller interface for APRS.
Does anyone thve information on the details of the Rockwell Binary format?

Thanks,

Ron, K0QVF

Hi Will....

Looks good...

If the current crop of uC based kits (like the TT etc) are anything to go by, you could probably remove the conversion to true RS232 (though I don't like their reliance on the uC's input protection to "convert" the serial in line levels) as an option to keep costs down even more?..... Most PC's seem OK with 0-5V levels these days... Though personaly, as the chips are cheap and available, why not use them (the RS232 level convertors).... As you thought no doubt....

What receive capability is there? Message passing or IO port bit flipping, or whatever....? (I'm thinking remote control and telemetary hear)

Hey Dave,
I thought about for going the rs232 level converter but I desided the protection on the uC's input was worth the extra $1 in cost.

As for the recieve capabilities my current software decodes packets and sends them out the serial port to a computer so I have been using it with WinAPRS and XASTIR. On my current circuit board there is a 0.1" center header that is configured for a LCD to plug into. A simple code change would allow mobile monitoring capabilities i.e. HamHud type operation. Or you could r/w the I/O pins for remote contol/telemetry. The uC also has built in A/D so the final board will make use of those inputs for a very useful telemetry unit.

Hi again Will....

Sound very much what I've been thinking about doing with a variant of the SOTT software, on a 16F877.. Lot's of extra IO, including A/D and PWM D/A etc... Not forgetting a "real" serial port, or two....

Not done anything yet except successfully port the SOTT code to the 877, and tell it to "idle" the (currently) unused ports.....

You've gone much further down the road by the sound of it..... Well done.... Especially with the RX facility. MUCH easier of course with a modem chip.....

I have too much else on to "play" with at the moment, but one day.....

Best 73 Will, more power to your elbow, as we Brit's would say.....

877. Part 97 vs unattended APRS trackers

Yahoo group: APRS (1998 — 2006)
Date: 2003-07-17 18:59:43 UTC
From: n500m
Topic: 877 Message: 877

Question for the group - I'm looking for clarification with respect to using unattended APRS trackers. I'm this years' ham coordinator for the Plano Balloon Festival, held in beautiful downtown Plano, TX. Last year, some operators got an APRS tracker in a balloon piloted by a licensed amateur, which was no problem. This year I'm looking to integrate APRS more tightly into our event operations.

I'm unclear as to the legal status of APRS trackers that we might consider putting on balloons that aren't piloted by hams. I understand that various ham gear is used on unmanned balloons, but I've received an objection that the unlicensed pilot of a balloon would be considered to be the control operator of the station, which would be illegal. Upon looking at the rules, I find:

- 97.109 states that a station may be automatically controlled, but must turned off if the operator is notified of improper operation
- 91.221d appears to the automatic control of packet stations running on 6m or higher bands.

So - if the APRS tracker were locked up such that the station could not be turned on or modified by the unlicensed pilot, the station would be under automatic control. The box might have an interlocked push button such that the station could be shut off from outside the box, but not turned back on again.

This question comes up fairly often and generally spurs a debate with more heat than light. You could check the archives for the TAPR APRS SIG for discussions.

Here is one message from my person archives:

>There are two opinions, "yes" and "no". Take your pick, with all the
>variables considered. Do us all a favor and DON'T write the FCC and ask
>their opinion. Never ask a bureaucrat a question that you cannot afford to
>hear a NO to. The bureaucrat's first instinct is to always say NO.
>
>I'm not sure there is an easy answer. You will likely hear "absolutely not",
>"sure, go ahead", "do it with caution", "do it at your own risk", "call the
>FCC" and any number of other responses. Don't take anything said by people
>who may respond to your query too seriously. (The arm-chair "regulation"
>experts seem to hang out on ham lists, with far too much time on their
>hands.)
>
>The primary issue appears to be "control" and how long a time it may take to

><vbg>
>
>73
>
>hasan schiers, N0AN

Here's another extract, this one being part of a debate between a "rules lawyer" and the guy that wrote and manages the http://www.findu.com APRS server:

> >I concede that as the control operator you may choose to operate a
> >tracker under automated control. However, if it becomes necessary,
> >you must be able to respond "immediately" upon notification that the
> >automated controls have failed.
>
>While immediately does appear in the general description of operator

>Not at all, I just call them up on the cell phone and tell them to
>unplug it. That is the procedure I have set up to stop its
>transmission to satisfy the FCC requirements. There is nothing in Part
>97 that says an unlicensed person cannot unplug a transmitter, only
>that they cannot initiate a transmission.

My own personal position: If you can tell the balloon crew to turn off a malfunctioning APRS tracker and they do it, you're golden in the rules. (I've done it that way myself.) I personally wouldn't even worry about the interlocked power button idea.

The D-7 is a nice, complete solution, although I am also experimenting with a TT3 with a VX-1r (or 2r) for an ultralite tracker. However if you are considering a Prism, you might want to get a GPS springoard module for one, because that will leave your port free for a keyboard, etc. Check out the Pocket APRS web site about this. I really like my Prism, and they are cheap (if you can find one). Only problem with it is that it doesn't seem to work with Fugawi maps. But of course a standalone GPS like a basic eTrex is extremely hand.

Guys, I went the Alinco-DR135T and a Garmin GPS-35PC for Tracking. The rig does 50 watts, and the GPS is the size of a computer mouse. Very nice package that I can travel with and it all connects into a Cig Plug. Not sure if this is in the original posters budget, but off the top of my head I think I have about $425.00 invested in this configuration and I use a spare Mag Mount 2M Antenna I had already. 73, Keith, K4KAL ----- Original Message ----- From: John Townsley To: APRS@yahoogroups.com Sent: Saturday, July 19, 2003 9:27 PM Subject: Re: [APRS] New to the group, seeking advice I agree. 884. Setting up a digipeater

Yahoo group: APRS (1998 — 2006)
Date: 2003-07-20 13:03:35 UTC
From: Les Wilson
Topic: 884 Message: 884

Can someone give me some advice on setting up a digipeater?

I have a KPC-2 TNC, WinAPRS, a 2m base setup and PC. For monitoring APRS and doing some TX on it - the setup works fine. But in this area where I live, my mobile isn't hitting the APRS system very well and I'd like to use my base setup to act as a digipeater.

As far as I can tell, the KPC-2 is capable of digipeating - so I don't think it's obsolete for what it is I want to do. However I cannot get WinAPRS and the TNC to work together as a digipeater. The WinAPRS documentation isn't all too clear on it either.

Also - is there a way for it to digipeat only select stations - or can you only do a digipeat all?

Or should I be using something other than WinAPRS?

Thanks!

73 - K2LES

885. Setting up a digipeater

Topic: 884 Message: 885

I'm trying to get a digipeater setup at my home QTH to relay traffic in an area that's the wide area digi's are not picking up.

I'm running WinAPRS 2.6 and utilizing an old Kantronics KPC-2 TNC.

How can I get the TNC and software to act as a digipeater. As it is, the current setup allows me to receive APRS packets, as well as TX my own, but I'd like to add digipeater functionality to the setup.

Is WinAPRS the right software? Should I use something else?
Is the KPC-2 obsolete for digipeating?
Can I get my digipeater to digipeat only selected stations - or is it an all or nothing scenario?

Thanks!

Yep, I will have to do that. I've been so busy doing all of this
that I know I have missed some resources. Thanks for the pointer!

This section sounds like remarkably sound advice.

This sounds quite reasonable and tracks with my own thinking. The
interlocking power button is my concession to the conservative point
of view is that if the unlicensed person can turn the radio back on,
they might be considered a control operator. Putting the power to
the system on a timer might also be a sop to this point of view.

My other concern is that if a general purpose radio (mobile or HT
rather than a fixed freq data radio) were being used and the
unlicensed individual had access to the radio, they might be
considered to be the control operator of the radio. In this case,
the simple expedient of putting the radio in a locked box resolves
the issue.

Thanks for the info!

Actually, digipeat is the wrong term in APRS. You want your site to be a RELAY and perhaps a WIDE node. I don't know about WinAPRS, but it would not surprise me to find that the current versions did this function. If not, look at APRS+SA -- you don't need Street Atlas for the majority of the functionality. There's also UIDIGI and XASTIR.

>Is the KPC-2 obsolete for digipeating?

No. When you use a PC, the TNC becomes pretty much an AX.25 modem. The PC does all the heavy lifting.

>Can I get my digipeater to digipeat only selected stations - or is it

I think so; depends on the software.

But in this area where I live, my mobile isn't hitting the APRS
system very well and I'd like to use my base setup to act as a
digipeater.
>

Easy to do Les, I just did it myself for the very same reason. In
WinAPRS "TNC setup window you should have a few lines of TNC init
commands left blank.(line 9 & 10 ??)to turn your home station into
a "relay" add the following into one of the bottom blank lines:

UIDIGI ON RELAY

All mobiles that your house hears sending "relay....." will be
digipeated. This also does callsign subtitution and will put your
station callsign in the string as the balance of the packet continues
on it's way to the WIDE's.
Good Luck

In my opinion.....

It would be simpler to use a TNC with an FRS radio.
It seems that Garmin uses FRS to transmit a persons location with their new GPS/FRS combo. So transmitting data over FRS must be legal. Keep the power with in the legal FRS limit and you should be all set.

Audiovox also has a GPS/FRS that arrived yesterday in the store for our
truck stop. Nice to use and we all got a unit to play with for new "Work"
radios. Personally I would stick with my TK-240 VHF.

All of our trackers are NOT user changeable for the event, only the power is accessible to the user for the event. That way its on or off for the tracker. I have the attitude that if my call is attached to it then no one is going to be messing with settings but me. Any problems get routed to me to fix either during or after the event.

In this area, the microwatt HT's used by FRS would be totally useless
for trackers on our public service events. 5 watt trackers are the bare
minimum to support bike rides and such in this area due to the
digipeater coverage here. And, near some tourist intensive areas, the
FRS freqs are useless for any activity due to high QRM. And you will
not have the Amateur APRS Digi infrastructure to support you.

We place trackers into vehicles used by Hams if they don't have other
APRS equipment, or, sometimes, into Event Staff vehicles so that we can
track their movements over the course. These folks as a rule carry cell
phones and can be called to turn off power to the tracker if a problem
comes up. Worse comes to worse, one of our hams can meet them and pull
the equipment. This is at least as much control as is exercised
legally by some repeater operators I know that rely on land line control
or have to physically drive to the site if there's a problem.

> I would like to suggest you contact Mr. Hollingsworth (rholling@...)
> and get it from the man himself.

And I would respectfully suggest that you DO NOT bring official notice
onto this issue. When dealing with any government agency, best to not
raise an issue if you might not like the answer. If Mr. Hollingsworth
had a serious problem with this issue, I'm sure we would have heard
about it by now. No sense in tempting fate.

The old Captn. Grace Murray Hopper rule: it's easier to ask
forgiveness than permission.

The bureaucrat rule (especially with the FCC) : Never ask unless
you can afford to hear "No" or "Don't".

Mike

Randy,

I understand what your saying.. "BUT"
I sure would not want to be the one testing the waters with my license.
I enjoy the hobby to much, and its on my critical path for my retirement.

It is good that the original author of this topic is asking for guidance.
There is a lot of opinion, but I would want it from the "horse's mouth".
A lot of people do things on there own, and when they get caught they say "I didn't know".
I am sure no one has been given a citation for abusing APRS?, but I could be wrong.

When I use my tracker it goes on when I turn the key to my ignition,
and goes off when I turn it off. I use it frequently while working HF Mobile.
So on long trips while in qso, I invite the person I am in QSO with to visit
my website and click on the link to see where I am.
Everyone gets real enjoyment from this, especially DX Stations.

There are a lot of people that are sure stretching the limits these days not only with
APRS, but to name a few HF Broadcasting, and the highly publicized
SSB HI-FI on 14.178 and the use of excessive band with.
Hey I'm for good audio.. I own 3 Heil Classics and a HM706 Headset and like the sound.
But all these equalizers, and guys modifying there rigs. Not going to go there.
I would still contact Hollingsworth. He is very good about answering emails on Q&A's.

The FCC is very aware Randy, because I have already seen an article discussing this issue
with trackers
setup by hams with no callsigns in them. Where the event name is used in the place as a
callsign for example.
So in this case you have a transmitter on the air with no identification.

Interesting discussion ,

Keith, K4KAL

As always, YMMV, and do what you feel comfortable with.

The way I understand Part 97, I have adequate control over my trackers. I also feel my speedometer is accurate, doesn't mean I'm going to volunteer to have a State Trooper run a RADAR gun on me to see if it is reading properly. Might not like the answer! ;-)

As for your other issue:
>
> The FCC is very aware Randy, because I have already seen an article discussing this issue with trackers setup by hams with no callsigns in them. Where the event name is used in the place as a callsign for example. So in this case you have a transmitter on the air with no identification.

I'd be interested in seeing that article if you have a link. I've seen one instance where that statement was made, but the person making the statement didn't really understand APRS. The event information was in the position packet, and the callsign was in the status packet, which was set for a 1/1 transmission rate, so the tracker did ID with every transmission, you just had to view the status page not the map. Don't know if this is a rehash of that same situation. (BTW, I put the event information in the status line on my trackers).

Anyone interested might also want to check the APRS SIG archives on the TAPR site as this issue has come up before.

How many of us have a tracker running in our vehicles that turn on/off with the ignition.

Do you/we make sure it is turned off when your wife or children drive the vehicle.
If your like me , no !

We are not really breaking the rules, just stretching the hell of them.
And I'm sure no one ever speeds, or rolls a stop sign...

Good topic , nice to see APRS is alive and well !

From: Tyson S.
Topic: 877 Message: 898

There are lots of ways you can go, MURS is available now in VHF at 2 watts, no license needed. If you use a Kantronics KPC-3+ for a tracker I wonder if anyone has ever tried to connect to one of these the same as you would if it was a digipeater? if you can connect to it in GPS mode then you will have the ability to control it remotely and be legal.

Just EVERYONE,,

DO NOT ASK THE FCC THESE QUESTIONS,, EVER!!!

Or you possibly won't have it at all.

>So in this case you have a transmitter on the air with no identification.

The callsign does NOT need to be in the APRS digi callsign field. FCC requirements state that the station transmit it's callsign once every 10 minutes, and this can easily be accomplished by putting the callsign in a Beacon that is transmitted once every 9 minutes (I've done this). Or, as Randy suggests, it can be in the TEXT of the APRS packet instead of the callsign field (I've done this too). These options are all perfectly within the rules.

As I said earlier, if you are uncomfortable, don't do it. Your ticket is not on the line. The person placing the radios and putting his callsign on them is responsible for making sure they run legally.

902. D-7 not getting out

Yahoo group: APRS (1998 — 2006)
Date: 2003-07-28 03:42:28 UTC
From: Barry_bogart
Topic: 902 Message: 902

In testing my Tiny Trak 3 (for use with a Yaesu VX-1r), I realized that my D-7 isn't getting out. I was able to exchange APRS messages with a friend maybe a kilometer away, but can't hit the mountaintop digi about 20km away (although the half-watt Yaesu can). There shouldn't be a SWR problem (I used the same antennas as the Yaesu), and my local ham shop says I am getting 3w out of the Kenwood. My frequency meter verifies it is bang-on 144.39. It receives like crasy , including the packets from the TT3/VX1r.

So does anyone have any idea what could be wrong? I have done the hard reset, and ALL the parameters look right. I have been using it for 2 years and don't think I missed anything! But I could have.

My guess would be that your packet path is not the same between the TT3 & the Kenwood.

Yea that is fine but if you are running a special event station and have 10
trackers out there
iding every 10 min lot of QRM with the reg packets two. Also it will not
work with findu.
Just use -1,-2,-3!!!

Let's see: 2 second ID transmission every 10 minutes, 10 trackers, that
works out to 20 seconds out of every 10 minutes for an ID. And note that
the ID transmission doesn't need to have a path (no RELAY or WIDE). The
channel can probably stand the extra load.

>Also it will not work with findu.

Not quite accurate. If the tracker packets make it to findu, they will show
up under the tactical callsigns, not under the amateur call. You can still
look them up on findu if necessary. Since it's not a legal requirement that
findu have the correct callsign, that is an issue that is driven more by
the requirements of your special event.

>Just use -1,-2,-3!!!

This will certainly work, and I have done this as well. I'm just pointing
out that it's not the only method that's legal.

Alas, can't do it. The rules had to be explictly written to allow
Garmin to do that. Otherwise, the rules explicitly forbid the
attachment of any device not explictly intended to be attached to
that radio.

Affirmative. In fact, we've had to keep our trackers to 25 watts minimum.

One observation I've had is the use of amateur radio with the various unmanned balloon projects. I'm tending to doubt that those have any manual or remote way to disable them. However, they are of limited duration, so the issue is likely fairly small.

I agree, I don't think we need to. This seems like an issue that can
be rationally thought out.

Something to look at. I'd like to find something as cheap as possible within the rules, though. We have 80+ balloons running, and while there's no hope of equipping all of them, we'd like to have several, and TNCs are more expensive than TinyTrackers.

But are the balloonist going to be looking for each other or is this just for the ground crews to locate them. You could use TinyTrackers in the balloons and then one or two TNC setups on the ground and relaying information to the crews.

When faced with this issue of equiping a non-licenced person with a tracker (ie my nephew's vechicle) I did a lot of hunting on the internet and did find a few commercial systems. One was used in fleet vechicles to track where they went and the data was downloaded each end of shift as the trucks would return. Another used cell phones. Because of this all being a grey area, I still haven't tried to put a tracker in that car.

We act as a public safety backstop for the balloonists. We have a
launch field operation and a chase operation. The balloons and their
chase vehicles are all equipped with tracking numbers. We track the
balloon crews on and off the field and we track the balloons as they
launch and are recovered. We work with the city communications ops
to ensure that emergency services are called when necessary and get
them on site.

So, in this case, the field and chase ops team both have an interest
in having APRS on the balloons. The chase ops can use that data to
limit their search areas, and the field ops can use it to help do the
city coordination. We can also take the accumulated data products
and hand them back to the festival organizers. They love that stuff.

I've been toying with the idea of seeing if we can get the cell phone
companies to provide a voluntary service where the location data
provided by the e911 capability in modern cell phones could be ported
out as APRS data. That'd be pretty nifty.

I've seen one project where somebody has built a PIC that provided an
attachment from a GPS reciever to a GSM phone, and the APRS data
transmitted as SMS text messages. That was a european thing, I
think. I'm interested to see how that might work with the various
american technologies.

These are pretty neat. But I'm partial because I work for the
company too. They do have very accurate GPS units and use the
Cellular data channels only. Never using a voice channel.

914. Trackers neede for MS bike event in Triad of NC

Yahoo group: APRS (1998 — 2006)
Date: 2003-07-28 02:40:15 UTC
From: kb1g
Topic: 914 Message: 914

The annual Tour To Tanglewood bike event is going to be held on September 20 and 21 in the Piedmont of NC. I need 5 trackers for SAG wagons to track their position. Can some of you folks please consider loaning some compact trackers and antennas for the event?

Those who could loan us a turn-key system for the weekend would be helping out a lot. Please email me at kb1g@... if you are interested. It would be cool to get them pre-loaded with tactical calls SAG1-SAG5.

Thanks,

Bill

915. Mobile Power Requirements

Being a newbie to APRS, I don't have a good feel for the digipeater network. In particular, what kind of power/antenna is required in a mobile out in the wild west? For example, I-15 between Las Vegas and Salt Lake City. Or I-40 across Arizona. Would an HT work OK, or would I need 50-watts to a 5/8-wave? Or??? I have a lot experience with voice repeaters, but don't know the capabilities in the APRS world.

Depends on your local coverage, and the examples you cite sound like
coverage will be thin at best. Data is much less forgiving of momentary
fades than voice. You might not even hear a 10db fade that lasts 1/20 of a
second, but that could be enough to ruin a data packet. A 5 watt HT might
work OK in town (subject to 'hidden transmitter' syndrome), but it will
probably be next to useless in rural areas. Better go with the 50 watts.

I run 5 watts on a gain mobile antenna and do
pretty good with it, even in areas where I am 20-25
miles (or more) away from the digipeater. One thing to
consider is how well the digipeater can hear, I keep
my digi's tuned up pretty good, but I have seen some
out there that took some good power and a good clear
shot to get into them. And this may or may not be on
purpose. Some digipeaters are attenuated to keep a
small coverage area for certain reasons. If I was all
alone in the Nevada desert I would want 50 watts. If I
was in downtown Seattle, I would run from 1 to 5
watts.

There is no official place that I know of for a
list of current digipeaters, but a trick you could do
is use UIVIEW32 to log on to a TIER2 server on a
filtered port of 14580 and set it up to allow only the
digi icon to pass down to you. This will cover the
entire USA map so you will need to be able to zoom in
to your area of interest. This will not be complete by
any means however, a lot of digi's out there use the
WX icon and it's hard to tell which is which. Smart
digi's will also use various icons too!

From: Andy KC2SSB
Topic: 922 Message: 922

Hello all. Me again. I'm still looking into the whole APRS thing and I have another question. If I do go with APRS, I think I will be getting a Handspring Visor Prism with the Magellan GPS Companion. Since the GPS will be directly conntected to the palm, I will only need to connect the TNC to the palm. Will the KPC-3 be ok for this? From what I've read, it will work, but I believe that the KPC-3 is only capable of working at 1200 baud. Is this a major deal, not being able to communicate at 9600 baud? Should I just spring for the KPC-3+?

923. RE: [APRS] KPC-3 OK for APRS?

Hi...

Forget all the expensive PC or Palm hardware... Unless you need it for other reasons...

But for the mobile setup, why not just use a TinyTrak. (or Son Of TinyTrak, a sort of clone with public domain source, same circuit as the TT)

GPS, TT (or SOTT), Radio, job done!....

You will need a KPC-3+ with the Ver. 8.2 or better firmware if you want 2-way APRS, running a computer and a GPS at the same time.

This gives you a "second" serial port. Actually there's only 1 physical DB9 connector, you build a Y cable with some pins going to the radio and 2 others, data in and ground, going to the GPS. You hook your Palm or other computer to the 25 Pin connector.

Also, the later versions of the 3+ have better firmware for handling GPS, digipeating, etc.

9600 Baud is not an issue if you're on the VHF 144.39 frequency. It runs at 1200 Baud there.

I don't know of any way to connect the TNC and the GPS to a palm at the same time. If you know how, let us know!

If you just want a tracker, TinyTrack is the way to go, but it is a transmit only, no receive.

Hope this helps

73

On a laptop or the palm you could use the HSP cable from Kantronics. HRO or AES carries it. It allows 2 devices to be attached the 25pin port on a TNC and switched the data from the gps to the computer every few seconds. 73, Jamie R. As a fixed station yes but you have no way of getting the lon and lat into it and the radio interface out of it at the same time. There are other ways around that but !!! The best is the + with ver 8.3. Your thc will work if you are going to run a APRS software on your PDA.

Yes I know the GPS is In the PDA but you still need to get the lon and lat to the TNC so it can turn it into a packet message and then sent it out of the TNC to the radio!!!

Ok, maybe someone discribed this already and I missed it in my pain killer induced haze... but I'll try to detail it. You CAN use a KPC-3 as a fixed station and as a mobile. Eariler versions you would need to have a laptop or some sort of computer to stuff the GPS data into one serial port and the TNC into another serial port ... OR ... you could use a thing called an HSP cable, The HSP cable shares the one serial port and is quite easy to make. Here is a link to the HPS cable schematics: http://nwaprs.org/hsp.htm The later versions, I beleive V5.xx on up are GPS ready and can go into stand alone mode. Meaning, once you set the parameters of the TNC with a computer using hyper terminl or whatever, you can then stuff the GPS NEMA data into the KPC-3 and run it without any computer or PDA attached. I'm currently running a KPC-3 with version 5.x firmware (I think its the first version that has GPS features) along with a Garmin GPS II+ and an Icom IC-2100H ... that is my mobile setup. At home I have a KPC-3 with an early version firmware - no GPS functions, I set my coordinates by entering my lat and long into the software (DOSAPRS) running on a 386 and I have a Kenwood TW-4100 radio (which will be changed out for a GE Delta very soon) TinyTrack units I hear are ok, but for the price of a tinyTrack, you can find a good working used KPC-3 and would be able to use it in 2 ways if absolutely needed (IE - APRS in normal use and Packet data in emergency use) I just like the redundancy... like NASA, have a back up for the back up. ;-) Dave N9NLU www.kmcnet.net --- vhfradiobuff@... wrote: > In a message dated 8/1/2003 12:25:16 PM Eastern > Daylight Time, > alignment@... writes: > > > As a fixed station yes but you have no way of > getting the lon and lat into > > it and the radio interface out of it at the same > time. Yup, you did miss it... ;) The setup I will be using is a Handspring Visor Prism PDA with Magellan GPS Companion. The GPS Companion is an actual GPS receiver that slips into the top accessory port on the PDA. This leaves the other port on the PDA (is it a serial port?) free for me to plug the TNC into it. I already have a source for a KPC to PDA cable. The TNC I use is a KPC-3 v5.1. I assume since the GPS will be plugged into the top of the PDA and will not need to occupy the same port as the TNC, that this will work for position reporting and will track my movement on the maps in PocketAPRS. The TNC will be plugged into an Icom IC-V8 handheld. I appologize for any redundancy here, but I am really a novice with this whole APRS thing. Once I assemble all the parts, the next challenge will be to get it all to work! (Look for another long thread when that happens! :)). Any additional input is welcomed. =-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=- 73! de Andy KC2SSB (ex: KF4KHC/HL9HCT) Beachwood, NJ USA! One more thing I forgot to mention. I intend on having the PDA hooked up to the TNC at all times so I can visually track other hams and maybe even send messages. I plan on getting a window mount. There are special mounts for the PDA with the GPS companion. =-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=- 73! de Andy KC2SSB (ex: KF4KHC/HL9HCT) Beachwood, NJ USA! Window mount is ok but keeping it on the dash or in a window it is in the sun all the time. Heat will mess it up. If you take a KPC-3+ you can run the pda if you want or not and still be sending data!!!

I guess my point is lost. If you were going to use a TH-D7 the GPS on the PDA is nice idea for walking. For in the car a cheap GPS with a ext. antenna and a KPC-3+ is the way to go and you still can plug your PDA into it. And you will still be sending data without your PDA pluged in. I run a D700 that way, If i want to run my laptop I can and if not I dont.

I can still plug my PDA into the KPC-3 because the GPS is specially designed to plug into the top accessory "module" port, not the serial port. I wouldn't have any use for having my KPC-3 to send without the PDA attached to it. Of course, my KPC-3 will still transmit without the computer. I found that out after I shut down the program I was running and my KPC-3 kept transmitting on the frequency (I was running a packet beacon). =-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=- 73! de Andy KC2SSB (ex: KF4KHC/HL9HCT) Beachwood, NJ USA! Don't count on finding a Prism, much less a GPS for it. Nice if you can, though, but a standalone GPS is awful handy by itself. Be sure to look at the PocketAPRS web site. You can get Handspring cables from Bluehillsinnovations, BTW.

I agree that a Tiny Trak 3 is a great solution too, if you just need to get tracked.

From: jeffreypkelly
Topic: 949 Message: 949

I have a Alinco DR-135TP (w/internal tnc) in very good to excellent condition. This radio was used with my SP3 for APRS. $175.00 plus ship.

Thanks for looking.

951. aprsd - igate

Yahoo group: APRS (1998 — 2006)
Date: 2003-08-02 20:33:32 UTC
From: jtwoodstock
Topic: 951 Message: 951

Hopefully someone can help me. I just downloaded and compiled the WA4DSY Linux APRS server.

The compile and install went very smooth.

With a few tweaks to the 4 config files, I brought it up.. I pointed the Java Applet at the server and voila, the map started filling up with stations..

On the TNC side, I have the TNC attached, however I have not fired up the radio side yet.. I wanted to make sure the traffic flowed properly before I did that.

After running for a while, I noticed that the igate was not showing on the map. I went to findu and looked under my call sign and -- nothing..

So it seems the inbound is working, but the outbound is not.

I did run the aprspass program to set the password to the value for my callsign.. What am I missing.. I have sent the author an email, but as of yet, no response.

Any thoughts?

Second Question - I'm running this igate because the machine I am running it on is my IRLP node. I was hoping to use the program udp_example and load the position for my IRLP node and follow the AVRS speck for the position record.. That program talks to port 1315.. How would I structure the message to that port to send out my node's position?

Thanks for any pointers..

Is there any way to change the amount of hours shown on a findu screen? The default seems to be 240 hours, which clutters up the data with people who have long since left the area. I would like to get it down to 24 hours if possible, or even less.

I am not sure about the regular display of
general stations like what you are asking for, but the
CGI script does allow for time changes when using the
plot or the track cgi, click on the link below, I set
it up to show 8 hours of data on a map for my local
area. It's pretty cool cause it shows the icons on the
map instead of the boring call tags.

http://www.findu.com/cgi-bin/plot.cgi?call=*&geo=http://www.qsl.net/w7oek/soaprs/so_oregon
.geo&start=8

You can even use a START and SHOW data. I.E. start 240
hours ago and show 4 hours of data.

959. Mapping w/ Laptop and D700A

Yahoo group: APRS (1998 — 2006)
Date: 2003-08-01 20:17:33 UTC
From: Brendan Johnson
Topic: 959 Message: 959

Hello everyone! I am fairly new to APRS and have a question regarding hooking a laptop up to a TM-D700A. I've heard of guys who have a Kenwood TM-D700A and somehow hook up their laptop to the radio and are able to display a semi-detailed map showing the locations of other stations around them, as they are received on the D700A. My question is, how do they do this? I have a P133 laptop (it aint much, but it does the trick), running windows 98, with a serial port and have been able to use it to program the radio. What kind of software do I need for this? Are there any tips from people who have done this before that may be valuable to me?

I should also note that I also sometimes run Garmin Mapsource on the laptop and use the tracking function to track my location. Is there any way to use Mapsource with the D700A somehow. I'm thinking not, but I guess I have wishful thinking.

Thanks in advance for the help!

Hi Brendon:

Welcome to APRS ! I have the D7 and a friend has the D700. There is a cable you can either order from AES (etc.) or build yourself that interfaces a computer's serial port to a 1/8" stereo plug, which plugs into your D700. The software gravitates to two items - WinAPRS and UI-View with Tow Software's Precision Mapping program (which works with both programs). Your P133 may be hard pressed to handle it, but I have successfully done this with my ol' Tecra P166 laptop. You have a good shot at it. I'd go for it - if it doesn't work, you have an excuse for a new laptop ;)

Jamie, good sugestion, but there's one problem. The GPS is plugged into the 1/8 inch plug you're referring to. Was wondering if and/or to run the mapping and APRS packets off the serial port on the D700. Not even sure if it's possible. Just curious to know how others receive packets and display them on a laptop, while the GPS is hooked up. I am dreaming here?

OK, Brendon - just talked to my friend with the D700. He says the rig has a DB9 serial port on the rig that interfaces with a computer. The 1/8" plug is strictly for GPS, so you are good there. It should be a serial to serial connection with DB9 plugs.

Hi, I just digi a google search for UI-Digi and found a few dozen download sites. Do the same and pick the best. It's been several years since I've used it. I would imagine it's improved since then.

969. KAM-E + APRS

Yahoo group: APRS (1998 — 2006)
Date: 2003-08-05 22:27:06 UTC
From: xe1zvo
Topic: 969 Message: 969

Hello.. I have a Kam-E version 8.2 and i saw there's few parameters to be configured as a digipetater. I made a config and i guess it's working, but i wan to know if there's a special config on the parameters. This Digipeater will be at the hilltop where our local repeater is installed and it's hard to get there, that's why i'll appreciate any tips. 73 de XE1ZVO

970. Announcement - 03 NTX APRS Workshop

Yahoo group: APRS (1998 — 2006)
Date: 2003-08-08 21:17:42 UTC
From: n500m
Topic: 970 Message: 970

The Comet Amateur Radio Club and Plano Amateur Radio Klub are sponsoring the 03 NTX APRS Workshop. The workshop will be held on September 6, 2003 starting at 9am in the Conference Center at the University of Texas at Dallas in Richardson, TX. The workshop will focus on practical APRS deployment for public service events. It will include presentation tracks on hardware (including the TinyTrak), software and operating practice, and is planned to include specific presentations on GPS and 802.11b (WiFi) deployment. Also, local subject matter experts will be on hand to help you get your equipment working! Talk in will be provided on the PARK repeater, 147.18 mhz, pl 107.2. An APRS beacon of K5UTD will be set at the event location. Presenters and other volunteers are needed. If you plan to attend, have questions or wish to volunteer, please RSVP to John Beadles N5OOM at n5oom@... or 972-898-0843. More information is available on the web at www.n5oom.org

971. Forest fires in British Columbia

Subject: status

The North Thompson valley in British Columbia and many other areas of BC are in a state of emergency due to severe forest fire conditions. Caoomunications at this time are adequate. Amateurs are working diligently and hard to maintain systems and mountain top repeaters. We are discussing other emergency comms options. We have backbone APRS system and most valley bottom staions are on emergency power. Shlould the emergency arise we may need to run packet locally on the APRS frequency.
I have sporadic I net access but we are surviving the current crisis. Thanks to all who are supporting us in our efforts. Our prayers go out to those who have lost their homes.
Kevin Deckert, Emergency Comms Officer, Clearwater BC

From: Geoff Kuchera
Topic: 972 Message: 972

Well The subject says it in a nut shell.
I was wondering if other people had done this and if it is legal?
I want to put a aprs tracker in my wifes car. But my wife is not a
ham and has no inclination of becoming one. It would be a transmit
only type of tracker with just position info no message capibilities etc..

Thanks for any information in advance

Topic: 973 Message: 973

Hello APRS Heads -
It's been years since I've posted to this
list, or even done any APRS or ham. So
please excuse my rusty brain.

Registered WinAPRS, when I start the program,
I know there's a way to tell it to NOT display
the splash screen information that you have to
"OK". I forgot the keystrokes..:-/

How do I kill the opening screen, please?

Thanks - N?EQ - Phoenix

Topic: 972 Message: 975

My opinion is it's fine as long as you can remain the "control operator". For me, that means that I have a method in place to get it shut off if necessary within a "reasonable amount of time". So, I can call my wife on her cell phone and tell her the pull the little plug out of the cigarette lighter jack. Or, I can wait until she gets home from the store, or home from an out of town trip even, and do it myself. She's not going to touch the controls, but you could make sure of that too by putting the equipment in a locked box. I guess if I felt the need to do THAT, I wouldn't elect to place the tracker in that situation.

It's no different than putting a repeater up on a mountain top. There's no licensed ham in attendance for that either, and I certainly don't own the site so it's in somebody else's building. Not all repeaters have remote control capabilities and it might take of couple of DAYS to arrange site access, transportation, etc. Don't think anybody's lost their ticket over that though.

It's become a very common practice and I think there would have been some fallout from it already if the FCC didn't approve. (Obviously this is for US only, I don't know anything about unattended operation for other countries.)

Yeah this has been a big discussion in the past
and everything seems to be directed at "being the
control operator who can shut it down if something
goes wrong" I fully understand the law that says you
need to be able to do this, whether its a repeater or
a tracker. And like Ron said, sometimes repeaters hang
on for days before they get fixed and no one gets in
trouble because the problem was fixed in a reasonable
amount of time. I mean, its a hobby, we are not the
FAA at Chicago O'Hare' if something is acting up for a
day or so, what's the big deal? And also what can
happen to a tracker anyway? If the TX were to stick on
because of the TNC getting messed up the TOT in the
radio is going to shut it down, if the TOT was
disabled by the user then I would think a
non-commercial "ham" radio would most likely burn up
the TX circuit in just a matter of hours and stop
transmitting forever. Just use common sense and don't
abuse the privileges we have.

Or a digipeater for that matter.

Also consider this - my tracker in my car. I'm only operating the vehicle for about an hour a day. The rest of the day it's sitting in my garage, driveway, employer's parking lot... sometimes yes - my wife does use my car. 90% of the time my tracker is unattended and it could be hours before I realize there's a problem with the unit.

I would think that as long as YOUR callsign (perhaps with a SSID appended) is being transmitted and the vehicle is in your name (or jointly registered), there won't be much of an outcry from the local APRS gang.
(even without the registration)

I realize you're asking about the legality, but if no one locally has a case of the hates on for you - I doubt it will ever be picked on.

Thanks for reading my input on this.
I know it's not legal advice...

I have had the same problem in the past with trackers in special events, the soultion is to wire the tracker in such a way that the user (the driver) cant change ANYTHING that would endanger your call. Example we put the trackers in a box and locked it so only the power switch was on the outside, even better thinking about it it would have been better to wire it to the ignition but the cars and trucks were rented. That way when the tracker was on nothing could be changed. If the tracker was not behaving in the correct manner I had my cell plugged into the comments for people to call if need be to report it. It saved a lot of work for the event as I could NC from either the street or the main office. The main thing is if your thinking of a tracker then be sure that you REALLY want your license on the line with having a non-ham messing with the equipment! Now thats not to say that your spouse is going to be messing with it, but just in case CYA.

Bruce,

It may be time for you to upgrade your mail client and enter the '90s.... ;-) More and more it's become the standard for hard breaks to produce paragraph separations, and for line wrapping to be a dynamic function of window size. I don't like it much, but that's the way everything's headed.

Most modern mail readers wrap incoming text for you if properly configured. I gave up and quit complaining about unwrapped messages about four or five years ago, and haven't seen a mail client for quite a while now that wouldn't automatically wrap.

On the other hand, people who read their mail on the Yahoo!groups website often find that the window becomes extremely wide if there is no word-wrap. The scroll-bar is on the bottom and it is a pain!

Another of many reasons I hate web-based email.

From: martinmaxwell85224
Topic: 987 Message: 987

Hi All!

I was thinking yesterday as I watched the coverage of the power outage on the east coast and Canada. I was wondering "what if?" Perhaps you were involved in it. Were you? What did you do if anything?

If something like this were to happen in YOUR area, what would you do? As Ham radio operators we would normally mobilize our equipment and personnel to help deal with the situation. Who would you (we) call? Are they prepared to accept us to help out? What have you done in your area to make local officials aware and willing to accept our assistance and put us to work in a situation such as this?

I think its a good thing to talk about, and just take another look at our state of preparedness as a group (of hams) and as a citizen of this country also.

Lets kick this around a bit and see what we can do, or what have YOU done in YOUR area that perhaps hams in OTHER areas of the country can do to prepare in their area.

I was in contact with our County EMA office when it hit. In fact, I was their first notification, they hadn't heard about it yet. I actually got early notification due to my "day job" as several of my client sites and support teams called in to report they were down. When I found out that Detroit, Toronto and Cleveland were affected, I got that "Oh S**T type of feeling and contacted the EMA. It just hit CNN.COM as they answered the phone.

After checking to ensure that our grid was south of the affected one and that we were not likely to lose power, the EMA director double checked my pager number and if I didn't hear anything else from there, no news was good news.

If requested, we would have deployed hams to the EMA situation room and where ever else directed by the EMA to provide back up communications. One link we would have manned would have been the one to the State EMA. We also have hams set up to respond to area hospitals to provide them with hospital to hospital comms, as well as connectivity with the EMA.

And to tie into APRS. We are setting up an APRS station at the EMA, and have several vehicles with D-700's, as well as TinyTrack based trackers we could put in to critical assets. The EMA director is very interested in that capability.

I was in Kingston Ontario (near Watertown NY) working when the power went out with a workmate. My home QTH is just north of Toronto and his is London Ont.

The first thing I noticed was that no one new what had happened or when power would be restored. Neither of us had enough fuel to get home and no stations had power/backup power to pump fuel.

As it turns out most of the local radio stations were unable to get info either.

With in minutes of the power failure cell phones quit working as I figure that everyone was calling everyone else !

I had eaten a late breakfast around 1000hrs but by 1700hrs I was starving. No food places were open and the grocery stores would not let you in.

Just as food panic was about to set in LOL! the hotel we were staying at(Howard Johnson) set up some BBQ's on their patio out back and were offering Steak sandwiches and Sausages on a bun. The beer was still cold so we stayed there till they closed down at sunset (about 2030hrs).

We were lucky as power was restored to Kingston Thursday night at 2300hrs. Now we could not drive home as we had drank to much beer !

Friday with the power on in Kingston we fueled up and headed home.

Radio reports said there was no power on in Toronto or surrounding area's. Only a few pockets had power.

Any gas stations that were on had line ups of 20-30 cars or more.

On the highway 401 which runs from Detroit to Montreal one service center that did have fuel had a one mile long line of cars on the side of the highway waiting to get in.

When I got home we did not have power either nor did we get it till 2130hrs Friday night almost 30hrs with out power.

I think what made this situation stay civilized was that it happened at 1600hrs and people had about 5 hrs of daylight to plan what they had to do. If this had happened at 2100hrs or later I think chaos would have broke out in the big cities.

Listening to a talk radio show last night (Saturday) there were still old people stuck in their apartments, hot and with little food and in some

cases no water unable to get down because of the high floors at which they
live.

From an amateur radio stand point ,
- I could not get into any of our local repeaters
- I could only contact one person on VHF calling frequency
- I did not have back up power at home so I could only operate from my vehicle
- I do not believe we were prepared

Our new season for our ham club starts on Tuesday the 2nd of September and
we'll see what took
place from an emergency planning stand point.

Thanks for the rant !
Now I will go camping this Saturday and appreciate my electrical camp site
and work some DX....

I have see that PK88 has an Eprom similar to the one used on Tiny2.
This is a 27C256 or a 27C512. Now.. can i program an Eprom with
UIDIGI and install it into a PK88???? will it work similar as Tiny2?

995. Re: East Coast Power Outage, what if?

Yahoo group: APRS (1998 — 2006)
Date: 2003-08-18 13:13:39 UTC
From: KE4RCO
Topic: 987 Message: 995

In answer to the What If? This past december we had widespread power outages due to an ice storm here in NC. There were a lot of hams that answered the call to RACES/ARES in the larger metropolis area of Charlotte, and Gastonia, NC but in the smaller areas where I live there just was not as much response. Once the situation was assessed and we contacted EMA we sent our EC to the EMA office and he relayed info from them to us. We sent a few operators to shelters to provide comms for Red Cross, and also was able to relay information back to EMA. we did utilize APRS to send text messages back and forth thus leaving the voice channel open for emergency comms. this also allowed for the text messages to be printed and delivered error free as sent, if we needed that option.
We did send some of our county members to other counties to assist with shelters and comms due to the need in those areas. Fortunately even as we are in a rural area, there was not a lot of people needing the shelters, most just put a log on the fire, cuddled up with the loved ones and weathered it out. I did have a few stressful moments when I found out the teenagers had used all the gas in the gas can for the go-cart, and I had to siphon gas out of the vehicle to put in the generator. I got the generator going, pluged up the computer to have my internet access, hooked up an electric skillet, and coffee pot, and invited the neighbors over for some hot coffee and breakfast. Then I went to one of the local shelters to help the community.

For the most part, we kept in contact with the EMA through the EC and did what was needed, we tended to our own families first and made sure they were taken care of, then we went out to help other families. There were only a few minor differences between ice storm blackout, and the summer blackout up north. We were cold and Y'all were hot (yes I said Y'all) but always make sure your families are taken care of. Keep gas for the generators, and spare batteries for the flashlights and radios. The jump start battery packs, that are sold almost everywhere now, are excellent for emergency comms. they will charge from the car, and are easily portable to carry with you. most have lighter sockets for plugging in handhelds to charge or even run a mobile. j-poles are convenient antennas, the roll up kind are really portable, and can just about be put up anywhere. And make sure if running HT's with external antennas that you have the right adapter to put on the radio to fit the coax ie. sma to so239 etc.

Hope all goes well and we can all learn from every issue.

Topic: 987 Message: 996

Hi Bill!

Thanks for the story!! How "enlightening." uhg.. sorry couldn't help myself.

*** Forenote*** Anytime I use the word "you" in this message, I don't mean YOU specifically, but the COLLECTIVE "you" or US, I, WE, etc..

Anyway, since you went through it, what would YOU suggest be done? Obviously you want to plan for future events like this right? What kinds of recommendations are you going to make to your ham club to be better prepared NEXT time? (Hopefully there won't BE a next time, but what if there IS?) They are OBVIOUSLY going to be putting in some new equipment. That equipment has to be tested! Its new, so its BOUND to fail a few times before they get it all worked out!

What if there is another terrorist attack?? I mean, do you REALLY believe that the crazies that wear dishrags on their heads are not going to NOTICE what this event did to us? Does anyone think that THEY aren't willing to try this again? I am sure they will!

How about:
Solar powered repeaters with battery backup for night ops?
An electrical gennie at home so you can operate your base station fully equipped with a computer so you can run APRS via RF since you probably won't have phone service, and should plan NOT to have it even if you did? Because others might not have phone service.

You mentioned that you could not get any info. Had other hams in your area, and in the New York and Detroit areas, been prepared in this way, there could have been some flow of information between you.

Speaking of which, is there a NATIONAL emergency frequency on EACH band? If there is, I am not aware of it. In a situation like this, there needs to be ONE frequency in EACH band that people can know to go to RIGHT away. This could be a centrally located repeater in your area linked to a national frequency, etc. Or say EVERY ham is instructed during local, regional, and national events to go to say 146.52 simplex and monitor that, as well as a specific repeater in your area that is central, has two at least two forms of emergency power (solar/Gennie/batteries)that can run indefinately without mains power.

Now what about getting information TO radio stations, TV stations, police, fire, power authorities? And getting it FROM them? Do you have a calldown list of all the people in your area who are willing and able to participate? What equipment do they have? Who will go where? Where is your Emergency Operations Center for the City? Say there are no phones or power, where will we Ham's go to stay "in the loop?"

Lastly, you mentioned that there were still elderly people who were trapped because they could not get down. How do we deal with THEM? I realize its not our "job" like it is for police or fire, but it IS our responsibility! What if it was YOU or your MOTHER up there in that building without A/C, running water, and running low on food? Wouldn't you want SOMEONE to go and take care of their needs? The fire and PD cannot do it they already have

their hands full!

These are all things that NEED to be thought out and discussed ahead of time with ALL the proper authorities so they will ALLOW and WELCOME us and our help and our equipment in such times.

999. Interface Idea for old KPC-3's

Yahoo group: APRS (1998 — 2006)
Date: 2003-08-20 01:48:05 UTC
From: Jacob Tennant
Topic: 999 Message: 999

I was thinking about a simple PIC based interface to help out those of us with the old KPC-3's to get the same functionality as a KPC-3+. If I am not mistaken the two TNC's function the same except for the second data port for GPS data.

My idea was basically a PIC based HSP type system whereas at a set interval the PIC would switch the data in line to the TNC from the computer/Palm/etc... to the GPS just long enough for the TNC's data buffer to get a good $GPRMC sentencs then return the line back to normal use.

For what little I know about PIC's this should be very easy for it to do.

Comments, suggestions, ideas ????

Jacob Tennant K8JWT

PS: Yes I am cheap and don't want to/ can't, spend the money on a new TNC right now...

1000. Kenwood TH-D7a w/ Etrex Vista

Date: 2003-08-20 19:48:24 UTC
From: Geoff Kuchera
Topic: 1000 Message: 1000

I was wondering if anyone else had this problem..

I'm using a Kenwood TH-D7a with an E-Trex Vista. and it works great. I found that this combo has the ability for the radio to set waypoints on the E-Trex. However it seems to miss the first letters of any call that has a SSID on it.. IE. KC0FXY-8 Comes out as 0FXY-8. This seams kinda weird and I guess I was wondering if anyone out there knows of a fix for it.

Thanks and 73's

Go into the menu under 2*3 (Waypoint). Select `9 digits
NEMA'. The
eTrex handles longer waypoints than many of the older GPS units that
would only do 6 or 7. Note: The D7A works around that limit when
needed by dropping the first few chars to make the callsign-ssid fit
in the allowed number of chars. `9 digits NEMA' sends the
full
callsign-ssid.

Just go ahead and the the schematics and put you you together a simple HSP cable. I used one on my KPC3 for a long time until I finally broke down and got a Kenwood D7.

The HSP cable essentially does what you are wanting with sampling of the GPS data periodically to send to the TNC

I don't exactly know where my schematics is right now, but I'm sure someone on some of the lists can get you the correct info.

Hi all: My PK-96 which has been in service since 1996, flawlessly, is my main TNC for APRS from my base station. I just powered it up after a 2 week absense. It fails to initialize --- 4 of the 5 front panel lights glow steadily --- everything but the XMT light --- and they never go off. some garbage data flows to the PC, but nothing intelligible.

This is not a low voltage problem --- I have verified that.

Any ideas on what I am looking for would be appreciated. Please respond direct to me, as I subscribe only to the digest version. Tnx. 73 de Brian W3BW

Several things could be happening here.

First, if you go to the TNC tab, do you see 'data' on that page? If not, you
have some problem in opening the TNC and check those settings on the
'Main' setup page.

If you see data there, then be sure the data for a station is all on the
same line. Sometimes in packet operations, you will see the header
line with the callsign etc on one line and the position data etc on
the next line. If this is the case, APRS cannot figure out who the
data belongs to. I think the command, if you have a Kantronics
TNC, is HEA OFF

If this is OK, then it could get a bit trickier with a lot of options
depending on what you have clicked or unclicked. For example
if you have a range filter on and yet have your position entered
without a MINUS sign in front of your western Longitude, nothing
will be within range of your station.

Anyhow, give these first several things a check out and report back
to the SIG

I am running WinAPRS v 2.4.7 along with PMap. I tried to upgrade to a newer version of WinAPRS and it keeps telling me that PMap is not registered on my PC. Win98 shows that it is registered. I have used these two for the past couple of years and never had to register PMap. What do I have to do to get the new version of WinAPRS to work with PMap?

Thanks!
Harry KC5TRB

Harry-
What version of PMap are you using. Older versions of WinAPRS only worked with PMap 3.0 or 3.5. I think newer versions of WinAPRS only work with PMap 5.0 and I'm not sure when the change was made.

No "official" Standard, but some suggested SSID's as posted occasionally by Bob, W4APR, the "father of APRS". Here's what he sent out in the past on the TAPR APRSSIG:

-3 ISS/Sat ops
-5 sailboats
-6 is when you are doing something extra special like FD
-7 (TH-D7),
-8 boats/ D-700
-9 mobile,
-10 motorcycles,
-12 jeeps,
-13 for RV's,
-14 trucks
-15 vans.

Meteor Scatter SSID: -2

Some are based on the early days when the SSID you used determined what symbol was displayed by the receiving station.

I personally use no SSID for my home station, -7 for my mobile when using my D-700, -8 for mobile at special events -9 for my tiny trak based tracker, and -6 for portable at special events.

Harry...To answer your question how do I get the new
ver of winaprs to work with Prec Maps try this link.
http://aprs.rutgers.edu/
click on the "MacAPRS? & WinAPRS? Documentation" link.

The "bible" is here. For info on Precision Mapping
click on "Precision Mapping support" link in the table
of contents.
A bunch of WINAPRS info is here.

1022. Mapblast APRS sites wanted

Yahoo group: APRS (1998 — 2006)
Date: 2003-08-28 22:32:03 UTC
From: Steve
Topic: 1022 Message: 1022

When I first learned about APRS I found a couple of sites where I could go that had good detailed maps displaying APRS stations anywhere in the world in real time. I could log on and watch as stations were tracked as they moved each time the info was updated. I enjoyed viewing APRS at the Baton Rouge APRS page at: http://www.qsl.net/kb5yhi/ until it started having problems. Then I linked over to http://www.kc5goi.net/java/javaaprs.html but even it's having problems displaying stations lately. While I like the searches at FindU , I miss being able to have a Map I can zoom in and out of which refreshes regularly so I can sit here with it running at my radio desk while I work 2 meter voice. Anyone got any good links that I can go to?
Thanks,
Steve, KC5SAS

The SSID in APRS is actually listed in the docs, but here is the original intentions with the input charachter, this is copied straight for the dosAPRS text file titled symbols.txt

/a LA AMBULANCE (SSID = 1)
/U PU BUS (SSID = 2)
/f LF FIRE TRUCK (SSID = 3)
/b LB BIKE (SSID = 4)
/Y PY YACHT (sail) (SSID = 5)
/X PX HELO (SSID = 6)
/' BH Small AIRCRAFT (SSID = 7)
/s LS SHIP (pwr boat) SSID-8)
/> MV CAR (SSID = 9)
/< MT Motorcycle (SSID = 10)
/O PO BALLOON (SSID = 11)
/j LJ JEEP (SSID-12)
/R PR REC. VEHICLE (SSID = 13)
/k LK TRUCK (SSID = 14)
/v LV VAN (SSID = 15)

Comon usage though hs made some adjustments to the above list.
A lot of mobiles that use the Kenwood D7 or D700 are using (SSID = 7) and a lot of mobile utilizing TNC's and tiny traks, at least in this area, are using (SSID = 1)

I think what you have here relates to a suggested method of indicating the symbol (using an SID) when specifying a symbol as part of the information field is not possible. I believe that this reaches back to when some hardware was limited to what could physically be included in the packet.

Since specifying the symbol isn't the goal for most that use an SID, which SID value is generally determined by local custom.

Here's a better idea. For about $15 get a copy of UI-View32 & a copy of
Precision Maps 6.0 for $50, connect to one os the APRS servers and
you'll have all kinds of stations to watch.

I have a Garmin Streetpilot III GPS in my car with a power+data cable. The DB9 RS-232 connector ends right beside the Mini-DIN data connector on my Yaesu FT-8100 (VHF/UHF). This has been the situation since my first Garmin GPS III+, I've been almost ready for APRS for several years and just needed an encoder. Based on Jeff Lehman's recent article in QST, I decided to order the TM-1 encoder (actually the TM-1+) so I could finally connect my GPS and transceiver and get into APRS.

A search of this group did not reveal any references to the TM-1. Does this encoder work as advertised? Anything I should know before hooking it up? Will the DB-9 connector on the Garmin cable work correctly with the TM-1 or will some of the pinouts need changed?

I'm also curious why Yaesu has not offered an internal APRS encoder in any of their rigs like Kenwood has. Did Kenwood get a patent or soemthing?

While visiting my local Radio Shack I noticed that the Delorme Personal Navigation Systems are on closeout for $39.95. The only ones available locally were the PDA version. I assume the GPS is the same as the notebook version but the included cable is for a PDA (I hope).
So can someone help me on a cable from the GPS module to a PC. Is there a way to get the data out to send to my Alinco 135? Is there a cheap external PS for the unit?

thanks,

Jeff Kelly

As of now I have not heard nothing. I have sent in several differnt times to Join The TRI-STATE GROUP and heard nothing, Now am I just wasting my time With APRS in my area EM99IJ or Am I doing something wrong, If so would someone Please let me know what I need to do,I would like to get a APRS node going here set up the right way, Which would I hope help other fellow Hams. 73 Randy k8khw

1034. PBL threat to Amateur Radio.

Yahoo group: APRS (1998 — 2006)
Date: 2003-09-03 02:21:22 UTC
From: Keith LaBorde - K4KAL
Topic: 1034 Message: 1034

Dear Ham Friends,

I was scanning 20 meter SSB the other day and came across a QSO between
two US stations talking about the Amateur Radio Hobby.
While listening, it was very reminiscent of my early struggles
when I was a young age attending Amateur Radio Club sponsored
class's at night to get my Amateur License.
I am sure some of you have similar stories about listening to code tapes,
and the hours of written theory, besides trying to do my regular studies
in Grammar School as I started at an early age.

Then one of the Ham's said, "Amateur Radio isn't a hobby, it's a Life Style for me!"

After thinking about this for a few minutes, I thought about my many
experiences and friends I have met over the years, and just how much
of an impact this Life Style has had on me. What would my life had been
like without amateur radio? My father died when I was 6 years old,
and Amateur Radio filled the gap and kept me off the streets of New Orleans.

With that said..

I recently visited the ARRL Website and reviewed the information on BPL.
This is very disturbing of what could be in our future, and the future of Amateur Radio.
I am planning to send a small contribution to the ARRL to support the
efforts to fight BPL, and I hope you can do same.
If you can't, I most certainly understand. These are tuff times for many of us.
But please forward this email to all of your Ham Friends in your address book
where we can at least get the word out, and educate everyone on this subject.
Please bring it up in your Club Meetings.

I also want to apologize if you consider this email to be Spam,
but take the time and go look at the data on this subject Please !

Thanks Again & 73's.
Hope to work you soon,

Keith A. LaBorde

August 2003

Dear Amateur Radio Club Members,

As summer fades and we anticipate a return to the rigors of fall, you will be reinvigorating Amateur Radio club operations in your communities. But before you club launches its activities, I hope you can take a moment at your next meeting and consider a disturbing and critical topic - Broadband over Power Lines (BPL).

BPL is a devastating threat to the Amateur Radio spectrum - especially the HF bands. There has been a lot of publicity on this issue - articles on the ARRL website (www.arrl.org/bpl <http://www.arrl.org/bpl>) and other ham radio sites. Your ARRL is at the forefront of the campaign to defeat BPL and will continue to work tirelessly to protect your Amateur Radio bands. And you can help.

This summer individual hams - and clubs - have responded generously to fund ARRL's efforts to fight BPL, and have filed comments to the FCC. But we still need to raise an additional $55,000 to fund the field measurements and document filings necessary to defeat this threat. We're all in this effort together, so I hope your club will jump on the bandwagon and support the campaign financially. We've received club contributions ranging from $50 to $2000. If your organization has already made a donation, thank you.

And if your club is considering a contribution, I hope you'll do so right away. With a contribution of $100, $250, $500 or more, your club can join the roster of clubs that are joining the effort. Your commitment will make a tremendous difference. And we'll put a list of contributing clubs on the ARRL website this fall as our way of saying thank you.

If you need more information on BPL for your club, go to the ARRL website (www.arrl.org/BPL <http://www.arrl.org/BPL>) for the full story, including copies of the two FCC filings and a video that graphically demonstrates the interference radio amateurs would experience from BPL. The video can be downloaded and played at your next club meeting, and there's a PowerPoint presentation you can use. Just follow the link above to an "Understanding the NOI" page and a resource page where you'll find the presentation.

ARRL President Jim Haynie calls BPL the biggest threat to Amateur Radio in decades - and hams have lent their voices to the cause. If BPL becomes a reality, many Amateur Radio activities, like Field Day, will be meaningless. Your club's support with a generous financial contribution now will help fund this effort.

Thank you for considering this request. Contributions can be made on-line at www.arrl.org <http://www.arrl.org>, or by mail to BPL Special Spectrum Defense Campaign, ARRL, 225 Main Street, Newington CT 06111.

73,
Mary M. Hobart, K1MMH
Chief Development Officer

"I can hear you...

Jeff,

I am going to assume you have purchased the Digitraveler GPS system
Radio Shack is closing out.

1. A good source of information is found at:
http://www.grundlgasse.at/thomas/digitraveler/
The page details the pinouts of the unit with the db-9 connector.

2. There should be more than one interface cable, spares are nice if
you make a mistake. The diagram at the website shows the connections
to a PC.

3. As for the Alinco, if you have the optional TNC unit installed,
you'll need to make/modify a cable to interface to the 135. 4 wires
and you are set to go.

4. the unit wants 6 volts- you can purchase a 6 volt wall wart or
for mobile a 12-6 volt adapter or if you want to save money, build a
power supply yourself. A LM317t with a couple caps and resisters
place a 1-5K pot will have you humming away at 6 volts with a power
source of 8V DC or more up to 35 volts.

I've configured my Digitraveler for use with the TinyTrak 3 tracker,
connected to a handheld radio. Nice little package.

In my initial testing, I have found the Digitraveler to be somewhat
deaf. It lacks an external antenna connection which woudl improve
its sensitivity. As it is, I get 60-70% lock traveling about mobile.

From: Jacob Tennant
Topic: 1037 Message: 1037

I use first.aprs.net for my igate and remember seeing a couple days ago something about other ports on it that gives you just the messageing feed, rf2inet feed, but not the massive station dump you get when connected to port #23.

HELP ME If you have this information. . .

Please not the filter stuff cause I cant get it to work???

Jacob Tennant K8JWT

1038. I think I got it!

From: Jacob Tennant
Topic: 1038 Message: 1038

I am using port 1314 now and it seems to work OK except that I can't tell if this feeds my local RF to the internet?

NO TNC/RADIO here yet, I am transplanting this into our 911 centers Igate in the next few days. Just testing here.

I'm not sure what "PBL" is, but I think BPL is a good idea to create more competition in the overpriced broadband arena. Of course, like cellular phone plans, competition hasn't done much for that. All I need is to give my power company $49.99 more a month (that seems to be a common rate for Broadband).

I'm not disagreeing with you, and I'm not well versed in BPL, but from reading your post, I don't know why you are against...just that you are.

Help us out here. Give us some of your reasoning to be against it.

Check the ARRL site at
http://www.arrl.org/news/stories/2003/08/21/4/?nc=1
take the time to watch the video linked to in the story

Bottom line, BPL has the potential to absolutely DESTROY HF operations
anywhere it is in operation. The ARRL staffer that was doing the survey
often found noise floors of over S9!

You may not operate HF, but that should be irrelevant. A lot of HF
types were not directly threatened by the Little LEO effort to take over
the 2m and 440 bands a few years ago, but most of them understood that
we need to cover each others backs or we all will end up losing.

Hope this helps

Subject: FW: Perspective

I sat in my seat of the Boeing 767 waiting for everyone to hurry and stow their carry-ons and grab a seat so we could start what I was sure to be a long , uneventful flight home. With the huge capacity and slow moving people taking their time to stuff luggage far too big for the overhead and never paying much attention to holding up the growing line behind them, I simply shook my head knowing that this flight was not starting out very well. I was anxious to get home to see my loved ones so I was focused on "my" issues and just felt like standing up and yelling for some of these clowns to get their act together. I knew couldn't say a word so I just thumbed thru

the "Sky Mall" magazine from the seat pocket in front of me. You know it's really getting rough when you resort to the over priced, useless sky
mall crap to break the monotony. With everyone finally seated, we just sat
there with the cabin door open and no one in any hurry to get us going although we were well past the scheduled take off time. No wonder the airline industry is in trouble I told myself. Just then, the attendant came on the intercom to inform us all that we were being delayed. The entire plane let out a collective groan. She resumed speaking to say "We are holding the aircraft for some very special people who are on their way
to the plane and the delay shouldn't be more than 5 minutes. The word came after waiting six times as long as we were promised that "I" was finally going to be on my way home. Why the hoopla over "these" folks? I was expecting some celebrity or sport figure to be the reason for the hold up.....Just get their butts in a seat and lets hit the gas I thought. The attendant came back on the speaker to announce in a loud and excited voice that we were being joined by several U. S. Marines returning home from Iraq!!! Just as they walked on board, the entire

plane erupted into applause. The men were a bit taken by surprise by the 340 people cheering for them as they searched for their seats. They were having their hands shook and touched by almost everyone who was within an arm's distance of them as they passed down the aisle. One elderly woman kissed the hand of one of the Marines as he passed by her. The applause, whistles and cheering
didn't stop for a long time. When we were finally airborne, "I" was not the only civilian checking his conscience as to the delays in "me" getting home, finding my easy chair, a cold beverage and the remote in my hand. These men had done for all of us and I had been complaining silently about "me" and "my" issues. I took for granted the everyday freedoms I enjoy and the conveniences of the American way of life I took for granted others paid the price for my ability to moan and complain about a few minutes delay
to "me" those Heroes going home to their loved ones. I attempted to get
my selfish outlook back in order, and minutes before we landed I suggested to the attendant that she announce over the speaker a request for everyone to remain in their seats until our heroes were allowed to gather their things and be first off the plane. The cheers and applause continued until the last Marine stepped off and we all rose to go about our too often taken for granted everyday freedoms. I felt proud of them. I felt it an honor and a privilege to be among the first to welcome them home and say, "Thank You for a job well done."
I vowed that I will never forget that
flight nor the lesson learned. I can't say it enough, THANK YOU to those veterans and active servicemen and women who may read this, and a prayer for those who cannot because they are no longer with us.

GOD BLESS AMERICA!

WELCOME HOME!

AND THANKS FOR A JOB WELL DONE !!!!!

1045. Losing satellites intermittently

Yahoo group: APRS (1998 — 2006)
Date: 2003-09-12 18:24:00 UTC
From: nessman@rochester.rr.com
Topic: 1045 Message: 1045

I have an eTrex Legend and lately it's been losing satellite reception on some days - while on most other days I have rock solid reception. It can take up to 20 minutes to acquire a strong enough signal for a short while before losing it again. I've even noticed that it's receiving 8, 9, 10 satellites around 1/2 strength and still cannot lock in a signal.

It sits above my dash and is powered off the car battery with a cable I bought from "GPSgeek" on eBay.

I've also noticed the same behavior with my yellow eTrex before I bought the legend.

Has anyone else experienced the same problem? Are there atmospheric conditions that can affect satellite reception (i.e., weather, radio "skip", etc...??).

Thanks!

So... Which Marine was it that had APRS loaded on
their O.D.Green laptop computer ?! And were they
allowed to operate it during the flight ??

I'm not unpatriotic, just the opposite in fact!
But this article is totally mute, not only from an APRS
standpoint, but from the logic that had the passengers
on the flight KNOWN who the VIPs were - there wouldn't
have been as much irritation at the delays, so your
attempt to ellicit GUILT has fallen on deaf ears here.

Come on, Keith... It's a nice fuzzy story, but it
doesn't relate to APRS (as far as I can see)...
And your crossposting it to a half dozen OTHER non-
related lists doesn't make it any more apropos, but
lessens it's impact than when distributed properly...

I'm assuming the Kenwood you're referring to is the d700. I am not familiar with winaprs. Have you tried using hyperterm to connect to the 700 to make sure you have an asynchronous connection with the 700. Once you've established a connection, you can issue a command like: display :to test the connection. You should see a display listing of all tnc commands from the 700.

Winaprs may have a tnc window to allow you to issue the command instead of going to Hyperterminal.

73,

Kevin

1051. Converting KPC3 to a Plus model?

Yahoo group: APRS (1998 — 2006)
Date: 2003-09-14 13:30:21 UTC
From: kbrackins
Topic: 1051 Message: 1051

I've read a few earlier posts but didn't quite get the answer.

Is there a major difference between the 3 and the 3+ other than firmware? I understand the firmware would have to be upgraded.

Someone posted a similar question and was told to go ahead and build an HSP cable but the repsondent did not give any other specifics. I'm assuming it's more difficult than just upgrading the firmware and using an HSP cable.

Of course the purpose of this question is to be able to use the 3 as a tracker.

1052. Digipeating with KPC3

Yahoo group: APRS (1998 — 2006)
Date: 2003-09-14 13:34:13 UTC
From: kbrackins
Topic: 1052 Message: 1052

I understand the the 3 model won't perform APRS digipeating because it doesn't understand path commands.

If you set it up on 144.39 in standard digipeating mode, is it safe to say that it would re-broadcast packets as heard? I know you would never see it's call aprs path statements but if placed in an otherwise no service area, you should start seeing signals repeated from that no service area.

Thanks, Kevin

> Thanks, Kevin
>

Hi again Kevin

The 3 will serve as a digipeater for trackers/packets that have
RELAY or WIDE in their paths. The 3 does not do the 'UIDIGI'
paths such as Wide3-3 or Relay2-2 etc. Thus if a 3 is placed
in a 'no-service area', the factor that determines what it repeats
is the originator of the packets.

If a station only used the UIDIGI format, they will not be
repeated. If they use something like Relay,Wide2-2, that
would be repeated by your 3 if it's alias was set to Relay.

Hope that makes sense and enjoy your new acquisition!

Jim

>

The 3 is not upgradable to a 3+ by just firmware. It has major hardware
differences that make such an upgrade unfeasible.

However, it is easy to use a 3 as a tracker. The operational concept is
that you program the 3 with all of the commands you want for your
tracker, then type INT GPS and turn off the power. Unplug the computer
from the DB25 connector and hook up the GPS. When the power is
restored to the 3, it acts like a tracker. To talk to it again, hook up
the
computer, power up, and type three CTRL C's to regain the command
prompt.

Of course what this does is make it a 'dumb tracker' in that you cannot
feed the output to any APRS software while you are using it as a
tracker.

The 3+ added the extra input capability for the GPS so the computer can
be connected to the TNC at the same time the GPS is. It can be used
as a 'dumb tracker' or can be used with APRS software and a computer
so the GPS info is passed on to the software and it can control when
the signal is transmitted. APRS+ has user configured settings to make
a 'smart' tracker which transmits when you make turns but has a very
low transmit rate if you are driving along a straight line. I use it in
my vehicle and have the APRS+ restore file set so when I turn off the
computer, the 3+ becomes a dumb tracker until the next time I hook up
the computer at which time the TNC init file resets the commands to
only transmit on command from the APRS+ software.

C U and good luck

Jim

I've not seen any mention of this in the main APRS sigs. There is a new version of UI-View 32 which allows the user to set up a webserver showing his current map, heard stations and such. The webserver is fully customizable to the users liking.

Here's a good place to start that will get the viewers into the webring.

>

The 3 is not upgradable to a 3+ by just firmware. It has major hardware
differences that make such an upgrade unfeasible.

However, it is easy to use a 3 as a tracker. The operational concept is
that you program the 3 with all of the commands you want for your
tracker, then type INT GPS and turn off the power. Unplug the computer
from the DB25 connector and hook up the GPS. When the power is
restored to the 3, it acts like a tracker. To talk to it again, hook up
the
computer, power up, and type three CTRL C's to regain the command
prompt.

Of course what this does is make it a 'dumb tracker' in that you cannot
feed the output to any APRS software while you are using it as a
tracker.

The 3+ added the extra input capability for the GPS so the computer can
be connected to the TNC at the same time the GPS is. It can be used
as a 'dumb tracker' or can be used with APRS software and a computer
so the GPS info is passed on to the software and it can control when
the signal is transmitted. APRS+ has user configured settings to make
a 'smart' tracker which transmits when you make turns but has a very

low transmit rate if you are driving along a straight line. I use it in my vehicle and have the APRS+ restore file set so when I turn off the computer, the 3+ becomes a dumb tracker until the next time I hook up the computer at which time the TNC init file resets the commands to only transmit on command from the APRS+ software.

C U and good luck

Jim

I think it has to be ver 6.0. Maybe some else has made 5.1 work but I
am pretty sure it was ver 6.0 that added that feature.

The KPC-3 and KPC-9612 need v6.0 or later to be able to send beacons directly from the unit.

KAM/KAM+ need v8.2.

Unfortunately it would appear that Kantronics now have a policy of only offering firmware updates to currently available models. Yeh, I know it's crazy!

1066. Re: Digipeating with KPC3

Yahoo group: APRS (1998 — 2006)
Date: 2003-09-15 21:25:09 UTC
From: kbrackins
Topic: 1052 Message: 1066

Hey, thanks for your help again Jim,

You seem to be a pro at the Kantronic's TNC's so one more question...

Will no models of the 3 handle the wide3-3 format? As version 6 and up will act as a tracker I was wandering if it had the UIDIGI command in it? I have recently purchased a 3+. It had UIDIGI as a command and I'm assuming it will handle the condesed format. Maybe not.

I've got a buddy who wants to sell a 3 he bought at a sale, but knows nothing about it. Because of it's small size, I'd like to bundle the KPC3 with a 50w mobile and put it at my sister's house (in an uncovered area) as a digipeater.

THanks again for you time, and 73.. p.s. What's your call?

No, it only did the conventional 'Alias' digipeating

>I have recently purchased a 3+. It had UIDIGI as a
> command and I'm assuming it will handle the
>condesed format. Maybe not.
>

Yes it will. You can check by typing UIDIGI at the
command prompt and it will tell you how it is set.

> I've got a buddy who wants to sell a 3 he bought at a sale, but
> knows nothing about it. Because of it's small size, I'd like to
> bundle the KPC3 with a 50w mobile and put it at my sister's house

That would be great as a standalone 'RELAY' digipeater. In fact,
and not asking the SIG for a rehash of the discussion of several
years ago, the KPC3 used a decoder which is much more sensitive
than the modem chip in the 3+. Until the UIDIG format caught on,
we searched out used 3's as opposed to buying 3+'s for our
digipeater network here in New Mexico.

73's and good luck

Oops

I may have to reconsider my answer on this. I read it as 'version 6',
which did not have the UIDIGI commands. Your question asked
"will no models of the 3" and to that I have to reply that if you
have the 8.2 firmware in a KPC3, it will do the UIDIGI.

Sorry for the confusion.

From: Barry_bogart
Topic: 1073 Message: 1073

I use the basic eTrex with my D7 and it works just fine. IMHO the features of the more expensive models seem to me to be not so worthwhile (screen is too small to see maps, and do you really need a compass and altimeter in a GPS?). Instead you can get good map software like Fugawi which also supports Palm/Pocket PC devices which can do a better job showing maps and managing waypoints. And with a Palm you can run PocketAPRS as well.

I bought one of the following units at Dayton this past spring and feel it
works great. I had been using my Garmin Legend up till that point.
I made up a new cable to plug into the PS2 connect that you can see in the
drawing. I put a split in the output to feed GPS data to my kpc-3+ and my
laptop for Streets & Trips.
This unit locks in very fast...!! 15 seconds or less from power up.

Subject: Re: [APRS] KPC-3+ and GPS info wanted

I bought one of the following units at Dayton this past spring and feel it
works great. I had been using my Garmin Legend up till that point.
I made up a new cable to plug into the PS2 connect that you can see in the
drawing. I put a split in the output to feed GPS data to my kpc-3+ and my
laptop for Streets & Trips.
This unit locks in very fast...!! 15 seconds or less from power up.

I use my Etrex Vista with my D7 and my 700 almost constantly. It's a great little setup! Now whether you need the Vista or if one of the lower models will do, that's up to your and your pocketbook. (my father once told me that if you buy the best the first time, you'll never be disappointed....)

I can't remember off the top of my head the differences in the lower models, but it deals with 3 things: loadable maps, electronic compass, and the barometer/altimeter. I've found the compass very helpful at walking speeds where the GPS can't always tell the direction you're facing. The loadable maps is your own decision, but I really like being able to load topo information in for hiking. As far as the barometer is concerned, it's neat but it's been wrong since the day I bought it simply because I've never calibrated it. I find knowing the general altitude nice, but lets face it, you're standing on the ground. ;)

I bought a D7 to play with before I got my ticket and it was basically the reason I continued on and got it. :) I really have enjoyed all the facets of it's operation.

That being said..... the biggest problem I've had using it for mobile use is sometimes the 5 watts isn't enough to hit the local digis. And you can pretty much forget doing it with the rubber duck, a mag mount or otherwise is essential.

All that aside, it's probably my favorite radio. I highly recommend it!

I guess I should clarify my high praise a little more..... I own both the D7 and the 700..... they are both great for their respective jobs and even more fun to play with together. (roaming digi for the portable, the whole remote control/crossband repeater setup) What it comes down to is whether you want a portable or a mobile radio.

Hi Jacob...

At one time I owned two of these great radios. The first was the early "A" model, then later I purchased the "A(g)" model. I used the "A" model for APRS work when I was camping and running around town in my pickup. When I purchased the "A(g)" model, I also purchased a Maha docking station to increase the power output.

I sold the "A" model earlier this year and now just use the "A(g)" model for both APRS and simplex and repeater work.

It's a great radio and fairly simple to use once you have mastered the menu system. I also owned the D700A that I wanted to use for digi work at the home QTH but sold the radio at Dayton this past year as it sat in the box since I bought it...

I believe that you would be quite happy with the D7A(g) should you decide to go that route...

I have been using the D7A for more a little less than
2 yrs. With an amp it works great. The D7A may be
easier to set up and tear down in your bus than the
D700 since you probably would want to remove any
devices from the bus when it is time to go home.
I carry a 17aH battery in a 12" carrying pouch with a
40W amp inside also. Just add a short coax jumper to
the radio, an antenna, and a GPS and away you go. The
battery lasts for weeks between charges.

Happy HAMming.

The power port power pack works for me for power and a 17 in whip antenna for gain. Hooked in to a etrex for position and all mounted into a RAM system for mobile use with an on glass antenna in the van. I also use the unit for my doppler with the TX rturned off as not to fry the system.
Any questions just ask dakotas@...

you'd need to have something intelligent in the mobile or somewhere else on the APRS network to realize it was for your mobile and do the forwarding...

probably the SIMPLEST thing to do would be to check findu messages TO your mobile (http://www.findu.com/cgi-bin/msg.cgi?call=va3kvd-15) periodically, or write a script to check that page periodically. You could bookmark it and then "subscribe" to it in IE, which will tell you with a little red * when the page has been updated. Second to that would be to connect to an aprs-is server (http://www.aprs-is.net/) and look for the messages there... either by setting the filters, or writing a program that would look for it ans alert you, and potentially even forward it to your home station.

perhaps some of the APRS software at home can be set to react to other callsigns aside from the one it is beaconing?

Hi
this is easy to do if you have text e-email on your phone
that means you get all txt messages sent to an email...
All you have to do is get winpak and get that to sent all e-mail as plain
text
this works for me i am with bt celnet for my mobile and all txt messages are
sent my pop3 Internet mail account then winpak sends this message out via
radio ...

Warning this may not be Legal to do on the ham bands if you don't have a Nov
on your license.

automaticly?

you'd need to have something intelligent in the mobile or somewhere else
on the APRS network to realize it was for your mobile and do the
forwarding...

probably the SIMPLEST thing to do would be to check findu messages TO
your mobile (http://www.findu.com/cgi-bin/msg.cgi?call=va3kvd-15)
periodically, or write a script to check that page periodically. You
could bookmark it and then "subscribe" to it in IE, which will tell you
with a little red * when the page has been updated. Second to that
would be to connect to an aprs-is server (http://www.aprs-is.net/) and
look for the messages there... either by setting the filters, or writing
a program that would look for it ans alert you, and potentially even
forward it to your home station.

perhaps some of the APRS software at home can be set to react to other
callsigns aside from the one it is beaconing?

1097. APRSpoint

Yahoo group: APRS (1998 — 2006)
Date: 2003-10-03 19:36:21 UTC
From: Terry Neth N3XBO
Topic: 1097 Message: 1097

Any of you have APRSpoint? I got it when it was 149.95 and was told that there was a upgrade soon for some of the bugs in the program. Well no upgrade for over a year and I asked him about it and he said to busy with his first job. He still is selling the program now for 99.95 ripping hams off with a program that has a lot of bugs. be aware!!!!!!!!!!

Give UI-View32 a look. About $16 USD depending on the exchange rate and it's the closest thing to bug free software I have ever seen. If you're in the US, it integrates with Precision Mapping v5 or v6 (separate purchase).

Hi

I can highly recommend UI-View32. I'm working with it and have been for some years now. In coorporation with a dutch ham-oprator, we are working to have MapBlast maps supported in the environment. this would provide street level maps worldwide, to anyone having an adsl line...

1100. Alternate frequency?

Yahoo group: APRS (1998 — 2006)
Date: 2003-10-04 13:54:28 UTC
From: David Hopper
Topic: 1100 Message: 1100

Sometimes the frequency of 144.39 can be so busy that you can't get a (data) word in edgewise. Is there a alternate to 144.39 that can be used for local APRS operation or does just depend on the activity of the other packet frequencies in the area?

David - WD4JKH

1101. Re: [APRS] Alternate frequency?

Yahoo group: APRS (1998 — 2006)
Date: 2003-10-04 14:47:00 UTC
From: Phil Reed
Topic: 1100 Message: 1101

There's nothing official yet. You could use the older packet frequencies of 145.01, 145.03, etc. Be sure to give a listen first to make sure there isn't ongoing operations that you would be competing with.

You might also consider moving to 440. There's no nationwide standard yet, but messages on other forums indicate folks using frequencies like 445.925.

1106. Mobil Path for AZ?

Yahoo group: APRS (1998 — 2006)
Date: 2003-10-04 23:12:10 UTC
From: Dave Hargus
Topic: 1106 Message: 1106

I have a question on the path used for mobils. I just got back from a trip starting in California to Springfield, Mo and
back. My Kenwood TM-d700A was set to Relay,Wide,Wide. That worked nearly everywhere except Arizona. Between
Kingman, AZ and Winslow, AZ nothing was tracked. I picked up other stations in the area - lots of them, but
my position was never relayed. Does AZ use a specific path?

1107. APRSPoint

Yahoo group: APRS (1998 — 2006)
Date: 2003-10-06 16:56:05 UTC
From: AOV98
Topic: 1107 Message: 1107

Question:

Our group recently received our vanity call sign for our mobile command post (WA7AOV), and have a question for the group as to how you go about changing the call sign in APRSPoint.

When we try to change it, the program gives us a ""WA7AOV is not a registered user." Any idea how to go about getting this changed?

Any help would be appreciated!

Sincerely,

Mark Pringle

I'm about to wire up an radio for APRS operations that requires a 6 pin mini DIN plug. My local Radio Shack has no such beast so I will be cutting of the cable and 6 pin DIN off an old mouse and wiring that to my radio. I will need then to figure out which wires in the cable are connected to what number pin. Does anyone know if there is a standard colour code for mouse cables that corresponds to a pin number?

Your transmitted signal needs to enter an Igate
in order you you to get on FINDU. Since you live in
Arizona I know that there is a real fine Igate down
there which is KB7ZVA-1. He is in Yuma, I don't know
how far away you are from there, but try a path of
RELAY,WIDE2-2 and see if that will get you in there.

Date: 2003-10-17 12:10:20 UTC
From: ki4bmd
Topic: 1122 Message: 1122

Could anyone help me out with this problem,I have the Davis Vantage Pro wireless weather station and the Data logger,running winaprs2.72 and a mfj 1278 tnc
Aprs works fine,hooked the weather staion to it and turned it on in settings and gave it com port 1 at 2400 baud,seems to see the weather station in aprs because it brings up the graph with the info for weather station,in 10 hours it only send data once out to findu.com and then it was missing temp,
When i manually hit transmitt weather it does not send the data according from what I can see on the TNC.
Any Ideas Help or settings would be greatfull as I am at a lost with this,also it seems when you bring up terminal window for weather input the char's are funny looking tried changing the baud rates and no diffrence....???????

Well, if you are not going to be tracking in the car, you could use a broadcast only TNC like the "tiny-track 3" a box to hold it in. I'm personally using an ammo box.

You would need a small TNC like a KPC sized one unless you like
a large box TNC. I personnally wouldn't want it visable to me in the
car. Too much chance of an accident.

There is a Kantronics group also. If you don't get the answer here, you might try there. I noticed that Kantronics website doesn't list a version 9.

There is also a Elmer here at Kantronics:
http://www.kantronics.com/elmer/index.cgi

Best regards,
Fred

The Tinytrak3 can be found at:
http://www.byonics.com/tinytrak/index.html

There is also a Yahoo group dedicated to it:
http://groups.yahoo.com/group/TinyTrak/

I have one and think it is a good deal. It is only one way though, as in 'it only beacons position'. However, I monitor the GPS data with my Palm IIIxe/laptop and display my real position with it.

For home, you might use a KPC-3+ or similar. That way in can be a digipeater as well. At least that is what I am wanting to do.

Best regards,
Fred

1132. Street Atlas Auto Update

Yahoo group: APRS (1998 — 2006)
Date: 2003-10-21 15:35:20 UTC
From: Eric Potter
Topic: 1132 Message: 1132

I am new to APRS and am trying to use it for my senior engineering design project. My project is to send a balloon sattelite up with various measurements aboard. One of the biggest requirements of this project is to be able to track the balloon while it is in flight. That is where APRS comes in.
The problem that I am having is that every 5 minutes or so, APRS updates my Street Atlas and zooms out so that it can see everyone that APRS is tracking. I have played around with this and am unable to find the cause of this (I'm not sure if it is a setting in Street Atlas or APRS). This problem will cause a big headache if I am driving down the road trying to track the balloon and it automatically zooms out on me. Does anyone know which settings I need to change so that it will no longer do this?
Thanks,
Eric Potter

1136. APRS via a Gameboy or Playstation

Yahoo group: APRS (1998 — 2006)
Date: 2003-10-25 15:54:45 UTC
From: obrienaj
Topic: 1136 Message: 1136

In looking at how useful and portable my son's backlit Gameboy SP is, I thought how useful that device could be for portable packet operations, especially APRS activity. I also note that our Play Station II has two USB ports that go unused most of the time. Does anyone know of any packet or GPS applications that have been written for any of the various game platforms? I'm not sure there is an way to actually get audio IN to the devices but they sure can send audio OUT.

Just curious, are WinARPS and UI-View the only two clients that can connect to internet aprs servers? I can't get either of them to connect to any servers. I am just starting APRS, and I'd like to be able to leave my home computer on to log (perferablly both graphically and raw log) my loc/etc packets from the internet relay. www.findu.com provides raw log files, but I haven't found an easy solution to using those to display them on a map.

Probably there is a message related to this in the history, sorry if this is the case.

I use UI-View32 and it has been the most stable APRS software I have ever used. Connects to the servers just fine. Has excellent built-in help files and several free plug-ins to expand it's capabilities. I used WinAPRS for a couple of years and UI-View32 is definitely a big step up.

UI-View32 will also create that log file you are talking about with it's built-in UI-History function.

I played with it a little bit yesterday, but I need to find some sort of filtering options from the servers. :) I've never had my download bandwidth pegged before :) I continued looking around, and found out that www.findu.com 's "ling.cgi" will do exactly what I wanted. :) Now just waiting for my tiny-trak kit to come in the mail. :)

You can connect to port 14580 on any of the tier2 servers which is a filtered port. You have to send a message to the server to set your filter. In UI-View32 you enter this info in the "Extra logon text" box under APRS Server Setup under the Setup menu. Try using "filter m/500" as a start. This will pass all stations within 500 kilometers of your location.

Here's a good website to learn more about the APRS-IS: http://www.aprs2.net/

Give it a try! It works great!

You can get a Digi Traveller from radio shack at $29.95 , if they have any left...they are discontinuing them. It is a good GPS but is designed for a PDA, many hams have changed the connectors and using them with a laptop.

You can also get Tiny Tracker 3 for around $65, that is GPS and a TNC

I would like to find someone that could build a unit that plugs into the radio that would have a gps board, tnc board along with being powered by maybe a cr123 li-ion cell. With the tech of not needing a display and a short antenna should be able to have a unit that could snap onto the side of the radio.
Any suggestions?

Hello all. My name is Raymond Taber. I wanted to see if I can get something started in the ham community. In particular us APRS folks. Starting Jan. 1, 2004, I will start a digipeater from my house operating on a freq of 445.925 MHz operating at 9600 baud. It will be back-boned via internet. I would like to invite and encourage other hams to join me in this project all over the USA. I would also like to have weather stations to consider this if possible. I will be using a motorola mitrek converted and either a TNC or even a PC. Any folks intrested in this qwest, please feel free to contact me. I can use the help and encouragement. After I get this one built, I will build another one and put in where I can, and repeat the process one by one. My goal is to expand the great use the APRS system provides. Maybe eventually have a UHF APRS nationwide system up in place before I become a silent key. Wish me luck.

Topic: 1152 Message: 1156

I've been using a Sportrak for several months now and love it. It works great with APRS. It comes loaded with VERY basic maps but you can buy the Mapsend disks to load up detailed street level maps of nearly anywhere you want. I have it mounted in a optional vehicle mounting bracked which attached to the windshield with suction cups. It's powered by a DC cord. I got my GPS on sale for $150 after a rebate. I think it is a good GPS for a good price.

From: ki4bmd
Topic: 1157 Message: 1157

Has anyone got aprs working Winaprs2.72 so that when the National weather service issues a alert it will flash the county with the alert on the map?
I got the .shp files they say to use and have tried many times to get it to work on aprs and it won't
The way its suppose to work when setup the National weather Service will issue a watch,warning etc and with the files in place its suppose to show color for the county it has issued the warning for and times its for.
Any help on the files needed to set this up and setup for Winaprs.272 would be alot of help for our Skywarn net here in TN

From: Broncus
Topic: 1069 Message: 1159

I check mine again and it was much shorter. It was on a windowsill originally and it was messing with the signal.

I removed my batteries to add a 'stay on' resistor and noticed that the GPS reverted back to it's homeland of Japan. The batteries provide back-up power for recent data. I don't know how long the batteries can be out but it apparently is long to allow changing the batteries while driving. :^) After about 5 minutes the data is gone.

I uploaded a schematic on the Tinytrak group that represents the future of my TT3 and GPS. Part of the circuit is built in a test configuration while I finish the housing for it.

Best regards,
Fred

1161. Motorola phones?

Yahoo group: APRS (1998 — 2006)
Date: 2003-10-29 18:42:23 UTC
From: Ken
Topic: 1161 Message: 1161

Seems Motorola has at least two cell phones that have GPS receivers built in, the i205 and the i730. They are on the Iden system and appear to have A-GPS receivers built in and since my company may be supplying me with one of these I was curious as to whether anyone had tried them out for APRS?

1163. Re:Motorola phones?

Interesting, I too am looking it. I'll keep you posted if I do anything. I may have an advantage in the our company may do some custom programming with the GPS function and then I won't have to stuggle with a 'new' and smaller language.

Radio Shack Part number: 20-1601(PDA) and 20-1602(laptop). They are on close out, so they are cheap. About $30. I prefer the PDA versions because it comes with 3 cables and one can be quickly modified to work with a laptop. Cut the end off and add a DB9.

If you have a PDA, use the other cable to cut. ;^)

I ended up using a 12' phone extension cut in half. Since I only need RX and GND, I am running power down the other lines. But I am still messing with things, so I may change the cable again.

Best regards,
Fred

There aren't many left. I have rounded up two in Denver, but it took
some phone calls to find a store that had any. There aren't any of
the 20-1602 (laptop version) anywhere around here, I got PDA
versions. A great deal at $29.97. If anyone has the Delorme Street
Atlas software that came with their PC/Laptop GPS and would like the
PDA/handheld software version maybe we could work out a trade? I
don't need several copies of the same software. Ken, N0VZ

Does anyone know where I can get one???? There are none around here (Central NY). I've called everywhere within 100 miles. I'm willing to pay if someone can get me one, or even two. I'd like the laptop version but since those seem to be gone everywhere, I'll take the PDA version if I can get it.

I can pay by check, PayPal or whatever. Someone please help me out :-)

The first question that comes to mind is the USB hotsync port. To the best of my knowledge the port is a slave only port, which means your PC has to connect to it and peripheral devices can, ei. GPSs. Does it have RS232 capability?

There is a version of pocketAPRS, but it is only for the PalmOS.

For the Garmin connector, search Goggle for pfranc. It is an aftermarket source of Garmin connectors.

Best regards,
Fred

From: seventiesmp3
Topic: 1175 Message: 1175

Since the Laptop version is sold out, and all I can find is the PDA version, is it possible to cut the PDA plug and connect them to a DB-9 ?
Has anyone investigated the pinout ?

Thanks

Yes, you can do that and it works just fine. For the wiring/pin-out schematic, go to:
http://www.i-hacked.com/modules.php?name=Content&pa=showpage&pid=27

Aloha, Rick

it is possible to cut one of the plugs and make a serial db9 end for it. Delorme Street Atlas is what comes with the digitraveler. however for the pocket pc crowd. I am using the digitraveler with Micro$oft Streets and Trips 2002. This is working very well on the laptop and I didn;t have to get the Delorme Street atlas to run it. since the Digitraveler uses a standard NMEA out, at 4800 baud. this is standard on most GPS units and should be compatible with most mapping software that has GPS input.

the link for the wiring and the best info so far on the digitraveler is http://www.grundlgasse.at/thomas/digitraveler/

I search EBAY today and saw several listed.

I am trying to get a few more also, but haven't had too much luck yet.

Best regards,
Fred

1190. Re: [APRS] Radio Shack Digi-Traveller

Yahoo group: APRS (1998 — 2006)
Date: 2003-11-10 22:42:50 UTC
From: Andrew O'Brien
Topic: 1190 Message: 1190

I picked up the two remaining Digi-Travelers from my local Radio Shack today, and I will be mailing them to the two hams on this list that go hold of me first (they know who they are) . I also ordered two more from Radio Shack that should arrive in a week or so.

This will make a total of 10 of these devices that my local Radio Shack has found for me.. You might want to do the same. My local RS is able to look up on their computer any Radio Shack in their Region (not the whole country) They then call that store and arrange for them to be sent to them. You might want to try this method, if it fails let me know and I will see if I can get a handful more. I'm not making a money on this, just trying to help fellow hams.

My Street Pilot III has worked fine while I've had it on today. I
didn't look to see how many satellites it was seeing or how strong the
signals were.

Subject: Re: [APRS] Radio Shack Digi-Traveller

I picked up the two remaining Digi-Travelers from my local Radio Shack
today, and I will be mailing them to the two hams on this list that go hold
of me first (they know who they are) . I also ordered two more from Radio
Shack that should arrive in a week or so.

This will make a total of 10 of these devices that my local Radio Shack has
found for me.. You might want to do the same. My local RS is able to look
up on their computer any Radio Shack in their Region (not the whole country)
They then call that store and arrange for them to be sent to them. You
might want to try this method, if it fails let me know and I will see if I
can get a handful more. I'm not making a money on this, just trying to help
fellow hams.

1201. I have 10 Radio Shack Digi-Travelers !

Yahoo group: APRS (1998 — 2006)
Date: 2003-11-13 01:47:03 UTC
From: obrienaj
Topic: 1201 Message: 1201

I stopped again at my local Radio Shack and was informed today that they think they can get me ten more Radio Shack Digi-Traveler GPS units. These are the PDA version, a simple solder job will convert them for use with a regular PC. The 10 is based on how many I think I can sell without being stuck with them, the sales clerk says there are 13 available in their region, if the computer is correct.

So here's the deal. I'm willing to help fellow hams get these devices at no profit to me, all part of helping fellow hams. I stopped at the local post office today to figure out shipping costs. Turns out that once over a pound, the rate varies according to distance. With the envelope the device weighs 1 Lb 4 Oz.

Taking Florida as an example, the mail man said the costs would be $4.50 for a 4-5 day delivery.

So here is what it will cost you for one(if in Florida)

Digi Traveler $29.95 plus $.2.10 NYS/County sales tax. Total $32.05
Large padded envelope from the post
office $ 1.89
Postage
4.50

Total $38.44

Now, the way this Radio Shack gets these for me (I've had 8 so far) is that the very helpful sales clerk calls their stores in a several state region to make sure they have them, then asks if they are willing to send them to my local store. So far they have always said yes. This sales clerk, Mary, seems to be doing this out of the goodness of her heart. She is a young 20 something clerk, probably getting minimum wage. She is NOT a manager. She explained today that it takes time to call around the various stores and that she can only do between customers "when things are quiet".

I think this woman deserves something for her efforts. I figure if I can get 10 more, and convince you guys to cough up an extra dollar, I could give her a $10 tip for her really nice "extra effort".

So if you are interested, let me know. I already have 2-3 people that had previously let me know that I will be mailing privately (plus the two that I already promised). I cannot fully guarantee that Radio Shack will come through but i should know in a couple of days and will likely get them in a week or so. Do not send me any money until I have confirmed I can get you one, and have calculated

your postage. Please only order one if you are serious. I do not want to get stuck with laying out $300 and have no takers, although it looks like the demand is there.

Andy K3UK

From: obrienaj
Topic: 1201 Message: 1202

I made a slight mistake in the previous message. The postage in the Florida example should be $4.14 for Parcel Post, not $4.50. That should take 5 days. Priority Mail will cast $4.90 and takes two days.

All it takes is cutting the PDA connector off one of the three cords supplied and putting on a DB9. The bundled software is different but most people don't use it any way. The GPS module is the same regardless which package you get. You plug in power (or install batteries) and plug it into a computer and it starts outputting NEMA statements. Works with a PC, Kenwood D7/D700, TinyTrak, etc.

(Note: Due to the 'wake-up' feature requiring voltage on the serial line into the GPS some customization to the cable may need to be done if the device you are connecting to doesn't provide this voltage, though this seems like an uncommon problem.)

Here is a post I put on a week or so ago. this may help with the PC conversion of the digitraveler

This should help.

It is possible to cut one of the plugs and make a serial db9 end for it. Delorme Street Atlas is what comes with the digitraveler. however for the pocket pc crowd. I am using the digitraveler with Micro$oft Streets and Trips 2002. This is working very well on the laptop and I didn't have to get the Delorme Street atlas to run it. since the Digitraveler uses a standard NMEA out, at 4800 baud. this is standard on most GPS units and should be compatible with most mapping software that has GPS input.

The digitraveler will work with the IPAQ 38xx series I had a 3835 and let it go because I liked the compact size of my IPAQ 1910 then found out the it would not work with the 19xx series due to power issues and the wake up feature.

the link for the wiring and the best info so far on the digitraveler is http://www.grundlgasse.at/thomas/digitraveler/

All it takes is cutting the PDA connector off one of the three cords supplied and putting on a DB9. The bundled software is different but most people don't use it any way. The GPS module is the same regardless which package you get. You plug in power (or install batteries) and plug it into a computer and it starts outputting NEMA statements. Works with a PC, Kenwood D7/D700, TinyTrak, etc.

(Note: Due to the 'wake-up' feature requiring voltage on the serial line into the GPS some customization to the cable may need to be done if the device you are connecting to doesn't provide this voltage, though this seems like an uncommon problem.)

Cut of a PDA connector , you will have brown, black and red wires
.
Connect the brown wire to pin number 2 of your DB9 plug, connect red to pin
number 3 and connect black to pin number 5 and thats it.

If you use UI-View you should set up your GPS section in UI-View and you
will be all set. You should probably download the free Visual GPS software,
that is useful to check the receive signat strength and a few other useful
things. Look for Visual GPS via google.

1219. Re: [APRS] got mine/hooking it up

Yahoo group: APRS (1998 — 2006)
Date: 2003-11-15 02:09:01 UTC
From: Andrew J O'Brien
Topic: 1219 Message: 1219

I'm no expert on that stuff, don't have a tiny tracker but....

The Tracker 3 has two DB9 connectors on it, you would just plug in the Digi-T and set up the TT3 setup file to recognize the Digitraveler (comm port and the 4800 baud rate). Of course if you want to actually see the GPS display (a map or something) you need a laptop or something. That gets interesting in that you would thus need two comm ports on the laptop, one for the Digi-Traveler and one for the Tracker 3 (or other TNC), most laptops do not have two comm ports.

As for the Ft1500, you would not actually hook that up to the Digi-Traveler. You would hook the 6 pin mini-DIN plug of the FT-1500 to the tiny tracker, the other DB9 connector, I assume.

I believe that using a Digitraveler with a TT3 wouldn't work. One connecter is the serial port connecter and the other side is a radio data connector. The developer just used the DB-9 connecter to save space. I don't belive that the actual NMEA data strings pass through the TT3 raw. I pretty sure it's converted.

Nothing really, I orinially asked for 6 and the Manager said he
would hunt around, told his sales clerk to help me out since I
was "good customer". Since then Mary the sales clerk has been very
helpful. I'll stop by Monday to find out what the latest is on the
next 10.

I know when I first picked up my KPC-3 it took me a couple days to relize that when in GPS mode the GPS serial port does not use the same pins as PC terminal that way you can have both in use at the same time. Not sure if this is your problem but I over looked it at first.

Feel free to email me if you have any other questions or this did not help.

I thought only the 3+ with V8.3 supported the "second" serial port that you are describing. As for the original question, I would try reversing pins 3 & 4 incase you got them backwards. You also did not mention what GPS you are using, it may require an initiations string before it starts sending data.

Good luck,
Bernie, K3BAZ

Thanks for the replys to my problem, The GPS is the Magellan springboard module for the Handspring Visor Pro. It works just fine while I,am using the Pocketpc Program, but if I just turn on the GPS on I dont get no data to the TNC, The thing I can not figure out is why the KPC-3 won,t do anything when I issue the INT-GPS command and turn it of then back on as listed in the manual, I can not do nothing with it intill I do a hard reset. I have a file loaded up on the TINYTRACK Yahoo group. You can see what I did (or at least what I am working towards).

http://groups.yahoo.com/group/TinyTrak/files/Schematics/

A couple notes that are not on the schematic yet: I added a 20K resistor between the center of the input power jack and the serial RX line. This will keep the GPS powered up and locked as long as there is power on the input jack. I also keep AAA batteries loaded in the GPS (at least for now) to keep the last location backed up. If you remove the batteries and the input power, the GPS will think it is back in Tokyo and it will take longer to establish a lock.

The wiring I did allows monitoring my position with a laptop/PDA as well. And, I can quickly change the configuration.

When I get the enclosure finished, I'll try to get a picture of it posted.

I had mine running on a FT-8500 and FT-1500 at different points. The FT-1500 was the best. I use SQL on the data port. It works nicely on the first squelch setting.

As a side note: with the FT-8500 (dual band), I am disappointed that if I am talking on the other side, the TT3 will still beacon and the listener can hear it. So I will not use it for APRS.

My next step is to connect to my HTX-252 for a beacon. The FT-8500 will remain as voice radio and the FT-1500 will be moved inside the house for use with my KPC-3+ and UI-View or something. Until that is complete, the beacon is off the air, mainly because I have one antenna on the vehicle currently.

Hope this helps.

Best regards,
Fred

Topic: 1219 Message: 1234

The TT3 needs NMEA Data to do it's job. So, a GPS needs to be
connected to one end and a radio to the other.

--- In APRS@yahoogroups.com, "Warren Wheeler" <stonegrift@c...> wrote:

From: Broncus
Topic: 1217 Message: 1235

"The wiring I did allows monitoring my position with a laptop/PDA as well."

Let me clarify this a bit. By monitoring, I mean that the data is also supplied real time to the PC/Laptop/PDA AND the TT3 as NMEA data just like it would be if there was no TT3 (or other TNC). It is NOT received data from the APRS system.

To expand on how I use the GPS information:
I use CetusGPS to record tracks of trips that I do. I try to get out and off the beaten paths (no pavement here, 4x4 only!) and it is nice to have a record of the trip. Around town, I use XMap (PDA) or ExpertGPS (laptop) and sometimes something like Street Atlas.

In the future, the APRS beacon in my vehicle will become a full APRS node, minus the internet gateway.

Best regards,
Fred

http://www.cetusgps.dk <-- Palm application
http://www.expertgps.com <-- PC application, works best with WinXP (lots of small map files)

1236. Antennas

Yahoo group: APRS (1998 — 2006)
Date: 2003-11-17 19:20:28 UTC
From: Broncus
Topic: 1236 Message: 1236

Greeting,

I am looking to get reasonable antenna placement on my car. Here is the scenario:

Car: Ford Taurus
Radio 1: FT-8500, Dual Band (2M/70CM), radio with trunk mounted folding antenna. I use this one from the nortern fringes of a repeater, to the southern fringes. On the fringes I use 50W. I use both bands for voice.
Radio 2: HTX-252, 2M for APRS. I purchased a glass mount antenna. Radio will be operated at 25W.
Radio 3: HTX-10, 10M (when I get the license). I am thinking about a Wilson trunk mount.
Radio 4: CB (SSB/AM) radio (please don't shoot). ONLY for the occasional road report on bad weather days. I am thinking about a Wilson trunk mount, 36" version. No MODs on my CB and legal power.
Radio 5: 800MHz/1.8GHz, dual band radio (cellphone :^)). I have a glass mount antenna for it.

The 10M and CB would use the same antenna base, just different antennas. The feedline will be moved whenever the antenna is changed.

Antenna Placement Plan:
All antennas to be behind the passenger compartment.
The 2M/70CM antenna is on the trunk lid driver side center.
The 10M/CB will be on centered on the opposite side of the trunk lid.
The 2M APRS antenna and cellphone antenna will as high on the glass as possible on the rear window with some unknown spacing.

Now for the questions:
The primary goal is for the FT-8500 and HTX-252 and cell phone to play nicely.
What spacing concerns should I be aware of with the 2M antennas?
Can I expect problems with my cell phone?
Any web sites with guidelines?
And of course, there is some unknown question that your comment may address. :^)

Suspicions:
I may have to retune antennas.
There won't be much problem between the 10M/11M and 2M/70CM and 800MHz+ and 440MHz.
There may be some problems between the 2M/70CM-voice and 2M-APRS.
Someone here has done something similar (at least the 2M-APRS and 2M-voice).

I would appreciate any comments and concerns you may have.

Best regards,
Fred

1237. Re: [APRS] Antennas

Yahoo group: APRS (1998 — 2006)

From: Glenn Frasier
Topic: 1236 Message: 1237

I also have a Taurus. I use a comet dual band 2m/70cm mounter dead center on the roof for voice and I mfj 18" dual band 2m/70cm for aprs. Note that I have them on top of the roof with the mfj about 19" behind the comet. The trunk is fiberglass and so is no groung plane for the ant. The roof on the other hand is metal and provides a great ground plane. This gives me much beter pattern and range. I also have a scanner(dual band 2m/70cm) running on the front fender passanger side. In storm season I also run a 220 ant on the roof with the three forming a triangle with about 19"-22" on a side. Never had any problems with this setup....

Tripmates go on eBay for around $50-$60 U.S. I saw one go last week on eBay for under $30.00. I grabbed one for $25.00 on a buy it now deal the moment it came on line. I was just lucky in that case. I detail plans on modifying the Tripmate to work with the Tiny Trak 3 at: www.kd5om.com/tripmate.htm

1240. THD7E wont talk to my Garmin 35

Yahoo group: APRS (1998 — 2006)
Date: 2003-11-18 21:19:38 UTC
From: Paul
Topic: 1240 Message: 1240

```
The GPS works fine using visual GPS to my pc.
The THD7E works fine connected to my PC.
The seriel speeds are correct on GPS and the THD7E at 4800.
I'm thinking I have to input a string to the GPS to correct this
problem and make them "talk".
Any ideas?
Paul.

I picked up the two remaining Digi-Travelers from my local Radio Shack
today, and I will be mailing them to the two hams on this list that go hold
of me first (they know who they are) . I also ordered two more from Radio
Shack that should arrive in a week or so.

This will make a total of 10 of these devices that my local Radio Shack has
found for me.. You might want to do the same. My local RS is able to look
up on their computer any Radio Shack in their Region (not the whole country)
They then call that store and arrange for them to be sent to them. You
might want to try this method, if it fails let me know and I will see if I
can get a handful more. I'm not making a money on this, just trying to help
fellow hams.

Subject: Re: [APRS] Radio Shack Digi-Traveller

I picked up the two remaining Digi-Travelers from my local Radio Shack today, and I will be mailing them to the two hams on this list that go hold of me first (they know who they are) . I also ordered two more from Radio Shack that should arrive in a week or so.

This will make a total of 10 of these devices that my local Radio Shack has found for me.. You might want to do the same. My local RS is able to look up on their computer any Radio Shack in their Region (not the whole country) They then call that store and arrange for them to be sent to them. You might want to try this method, if it fails let me know and I will see if I can get a handful more. I'm not making a money on this, just trying to help fellow hams.

These days, the Tiny Trak 3 is probably your best choice, along with a
DigiTraveller from Radio Shack (discontinued, so start digging around) and
a used HT from ebay. There are also some pretty nice web pages that discuss
putting a Tiny Trak inside the battery compartment of a Delorme Tripmate.

As soon as my project box is complete (real work getting in the way), I'll be back on the air with a Radio Shack HTX-252 (closeout item), Radio Shack Digitraveler (closeout item) and Tinytrak3 (beacon only TNC). It will be a position beacon.

Best regards,
Fred

1250. Update on Digi-Traveler

Yahoo group: APRS (1998 — 2006)
Date: 2003-11-20 02:45:17 UTC
From: Andrew O'Brien
Topic: 1250 Message: 1250

Took them a while but my local RS confirms they can get me at least 7 digi-travelers, maybe a few more. Those people that have already emailed me are on the list to get one. Do not send me any money until I see the digi-traveler with the whites of my eyes, I will then contact the folks on the list. I'm sorry, but to the few folks that said they want 2 or 3, I will only be able to send more that one if Radio Shack finds a few more.

The Earthlink GPS doesn't output NMEA on its own. Instead it uses some binary format that pretty much nothing outside of a Delorme product can read. Now, you *can* get a special cradle that the GPS snaps into, which contains a processor that converts the binary stream to NMEA and comes with a standard serial cable, but that kills the cost benefits.

1255. GPS maps for low end laptop?

Yahoo group: APRS (1998 — 2006)
Date: 2003-11-23 18:37:43 UTC
From: obrienaj
Topic: 1255 Message: 1255

I tried posting this earlier but looks like it did not make it to the list.

I want to take my IBM Thinkpad 365X and the digi-traveler on a trip, no APRS use, just the laptop and the GPS device. I have Precision Maps but it is too demanding for my laptop CPU and takes up too much space on the small hard drive.

I would like some basic atlas type maps that I can have my kids monitor on the trip, they can refer to the laptop with Digi-Traveler when they want to know "are we there yet" . Something that displays bearing/altitude etc, would be nice. Does anyone know of any lower end atlas/maps programs that i could load on to a laptop with W95, pentium 130, 48megs of RAM, with about 100 megs left on the HD. I assume I would just load maps for the few nearby states we are going to, rather that the whole USA

From: Les Wilson
Topic: 1258 Message: 1258

I use Microsoft Streets and Trips 2001 on my P120/48mb laptop. The atlas data is on a separate CD so it's not using much hard drive space (the program itself only takes up about 6 mb of drive space). The program is fairly responsive, even on a lower horsepower PC. You'll need to download the GPS driver for the software from Microsoft.

You can find the software on eBay for around 5 bucks.

Street Atlas V4.0 and up to 9.0 will work great,
Version 4.0 can be found on eBay for under $10.00

You probably saw them on the FIRENET server. It has
all kinds of data like that.

Folks - PLEASE cut the unnecessary included text from your replies before sending them to the group. Especially for readers who subscribe in digest mode, messages consisting of three new lines of text appended to a dozen other prior messages with footers and so on are extremely difficult and annoying to read. Just include enough of the prior content to establish the context for your new comments.

Thanks...

-joe

Hi Jim,

Have you had the GPS on long enough to get a recent lock? When the GPS first starts up, it will send the last valid position, which is in Japan (Tokyo). After it gets a lock, then the data should reflect your location. It seems that mine have taken as long as 15 minutes or so to lock the first time. It seems worse if I am moving.

The GPS memory is battery backed-up. No matter what kind of power input you are using, batteries or input power, the GPS will reset back to Japan if the power is gone for too long. If you are using batteries, you will want to change them quickly. How quickly, I don't know. I would recommend installing batteries even if you are using the power input. This is what I am doing now.

In addition, I have also modified mine to stay on and locked (assuming clear view of sky) with power connected to the power input jack.

Hope this helps.

Best regards,
Fred

That location wouldn't be near Tokyo, would it?

That's it's wake-up position. Is the valid 'bit' set in the NMEA stream?

How long have you waited for it to initialize? I just fired mine up yesterday for the first time and it took about 30 minutes to put out any data. Once it did, it was pretty much right on with the info my Garmin puts out.

I have found that Staples is selling Delorme Street Atlas for 89.95 whereas Microsoft Streets and Trips sells for 39.95. I am using a Digitraveler with Micro$oft Streets and works fine. and it also comes with the PDA version built in. A lot cheaper than the Delorme Product.

Radio Shack called me and have confirmed that seven Digi-Travelers arrived and they are holding them for me. I will be busy for the Thanksgiving holiday and will probably not get a chance to pick them up until Monday. I will email the members of this list that have expressed an interest in the next day or so, I'll confirm their interest and payment arrangments. They are $29.95 plus sales tax, US Mail costs and $1.00 per unit for the nice RS salesclerk who put in a lot of time getting them from other stores. No profit at all to me.

No problem Nick no such thing as a stupid question.
APRS- Automatic Position Reporting System
Digi Traveler- a device that was sold by radio shack but no longer made.
Buy them, just ask the list
Digi traveler is used for GPS readings used for APRS.
If you have any questions let me know via mail

Maybe to learn?

Is there a book, a web site, or other resources where a newbie can learn?

If I remember correctly these Yahoo groups can be set to send an email
to all new subscribers. Maybe this "welcome" message could be used
to point a new subscriber to these newbie resources.

1277. RE: [APRS] new member

Yahoo group: APRS (1998 — 2006)
Date: 2003-11-27 03:10:41 UTC
From: nick919
Topic: 1268 Message: 1277

I joined the group because I have an idea what they were but I wanted to make sure I was right basically it?s a way to transmit your location so another person can follow along on a computer. I see where it has a lot of search and rescue applications now I am interested in learning more and possibly picking up a unit

So he can learn? All of us, I suspect, joined this list for that reason. Some of us are more advanced in our learning than others.

or, as Will Rogers, that famous Oklahoma Statesman, once said, "We're all ignorant; just about different stuff."

Have a happy holiday season

Are you saying that all of us JOINED this list without any knowledge of APRS? I find that a bit hard to believe.

Certainly, we all joined to learn.. but I think 99.99999999% of us knew what APRS was before joining this list.

1280. Mapping and APRS using one GPS

Yahoo group: APRS (1998 — 2006)
Date: 2003-11-28 12:16:01 UTC
From: n8miq1@aol.com
Topic: 1280 Message: 1280

Hi all,

I am at the "knowing enough to be dangerous" phase. I have been running a TT3 in the car and our club station aprs station(WC8VOA) on my jornada from my home. I really enjoy using my jornada with a CE mapping program (Ortisa) and an old magellan 3000xl. I was wondering if anybody has figured out how to use one GPS for the two functions above at the same time. I also have a sportrack. I figure I can steal the NMEA info from one unit and run it to both the TT3 and the jornada.

73, Karl, N8MIQ

Topic: 1132 Message: 1282

Hi Eric,

I'm not that familiar with APRS+SA, but look to see if you have "auto track moving stations", "auto refresh map" "zoom to tracked station" or something like that turned on. I had the same problem with WinAPRS.

I hope you also have another beacon on-board in case the APRS quits!

Where will your launch be from,how high, is there a web site?

From: Andrew J O'Brien
Topic: 1285 Message: 1285

Just an update folks, the Thanksgiving holiday and the snow storms in the past two days have delayed me seriously, I have not got to Radio Shack to pick up the 7 Digi-Travelers,

I have original emails to me about this topic from 2 weeks ago, but so that I do not get stuck forking out approximately $250 to radio shack (7 x $29.95 plus tax) just before Christmas. Can I get a renewed show of interest and a commitment to get me the $$$$ within a few days of me buying them.

Do not send me money yet... just your interest. Email me at obrienaj@...

Hi Karl,

I do a similar thing. I run my Tinytrak and send the GPS data to my Palm for diplay in the car. The way I achieved this was to split the GPS Rx signal to the TinyTrak and to the Palm. The Tx signal is not used.

If you require more info, just ask.

Karl,

Yes you can do just that. If you check on the TT3 website I believe they show you exactly how to wire up to do that. But suffice to say, connecting JUST the output of the GPS to each device input will do it. If I remember the diagram there might have been a diode or two involved in the interface????

One word of caution. You will not be able to use the Jornada serial port for anything else. It can't receive from the GPS and a TNC at the same time.

If you are at a fixed location, you should not need a GPS input to the Jornada for APRS. Simply enter the fixed location into the APRS software????

Good Luck,

Gene KI6LO

APRS KI6LO-9 (FT-1500M & TT3 - Mobile)
APRS KI6LO-10 (Home)
APRS KI6LO-15 (TH-D7A handheld)

From: Bruce & Leigh Coates
Topic: 1296 Message: 1296

Hi.

About a month ago I was asked to demonstrate APRS during a simulated search conducted by the local search and rescue organization. The search base was located about 100 km from the nearest digipeater, in Saskatoon. I created a web page with the details at http://www.qsl.net/ve5aa/CASARA/Casara.htm.

Enjoy

1297. 30-m Operating Frequency

Yahoo group: APRS (1998 — 2006)
Date: 2003-12-06 18:51:07 UTC
From: Joseph A. Counsil
Topic: 1297 Message: 1297

Hello,

I'm new to APRS (both on VHF and HF). I have no problems on VHF. However, on HF, 30-m, 10.15150 MHz, I notice that the beacons from from the gateway stations are right on frequency. However, I notice that there are many stations which are off frequency by as much as +/- 50 Hz. Of course, when they are over about 10 Hz off, I have problems copying them and must retune to see who they are.

As I understand, the precise frequency I should be operating at (considering the offset in my TNC of 2210 Hz) should be 10.15151 MHz, but I find that the gateways seem to all be on 10.15150 MHz.

So, I would like some comments about why so many stations on 30-m seem to be off. Poor frequency control? My problem?

Thanks & 73,
-Joe-
K0OG

1298. Newbie, APRS wantabie

Yahoo group: APRS (1998 — 2006)
Date: 2003-12-09 02:14:50 UTC
From: sinbad5210
Topic: 1298 Message: 1298

I am interested in getting a APRS mobile and stationary station up and running.

Radios available
-Alinco DR-1200
-Realistic HTX-202
-Alinco DJ-180

TNC's
-MFJ 1278 (no software, no interface cables)
-Kantronic KPC-2 (no software)

Computers
-Gateway Pentium II Tower (I use it for PSK)Windows 95
-Compaq 486 laptop (with WINAPRS, PMAP 3.0(for GPS), ProComm+, PMAP 3.0 (for APRS), Windows 95 (I got this at a ham auction a couple of weeks ago and trying to figure it all out)only takes 12v to operate
-IBM Think pad Pentium Laptop with Window 95 (got this one to do PSK qrp with my ft-817)

GPS
-Etrex (combination PC and power cable coming ebay)
-Mageillan 315

I think that the Kantronics KPC-2, etrex, compaq, and 202 would make a decent mobile operation. But I need some help on putting things together and am unsure if I need anymore software to configure the TNC. So please provide any assistance in connecting this together and what software I need as well as programming things.

For the base station the DR-1200, Gateway tower, and MFJ 1278. What software and interfaces would get me up and running?

Of course I am also thinking of using the DJ-180 with a tiny trak and an etrex as mini station. I realize that means buying the tiny trak, building it, programming it and making the interfaces. But that is another project. Etrex are on sale at Target right now... go figure.

Thanks,

Steve

From: ricging
Topic: 1236 Message: 1299

Hi Fred:

I have a APRS system and dual-band mobile rig.

A GarminV feeds a TinytrackerII feeds a Icom IC-02AT which feeds a Radio Shack 30 Watt VHF amp into the antenna mounted on the rear fender. (used AM antenna - replaced cable to 50 ohm and cut to tune VSWR) I have a loose wire inside the car for the am/fm radio not the greatest but stealth.

The dual-band is a Icom IC-207h dual band VHF/UHF 50/35 Watt which feeds into a glass mount dualband antenna center highest on rear window.

No problems but mainly I use 5 Watt VHF in Atlanta to hit ARC repeater. I have pushed to 50 Watts VHF and 35 on UHF occasionally.

Not sure about the hf antenna as I do not have those privileges.

Download, install and register UIVIEW32 on the desktop computer, use either one of the MFJ or Kantronics TNC's you have, they should both work fine in KISS mode. Use whatever 2 meter mobile radio with a power supply and antenna for a base station radio. The etrex and Tiny Track and HTX-202 will make a perfect low cost tracker. I have that set up myself. This should get you started and addicted, before you know you will gotta have a D700 or D7A(G)!!!

UI-View32 should be all you need. Use KISS mode if the KPC-2 supports that.
Be sure and read the help files in UI-View32, they are excellent and will
guide you through all the settings.

1306. Florida APRS D700 D7 group started.

Yahoo group: APRS (1998 — 2006)
Date: 2003-12-11 18:30:11 UTC
From: n1ahh
Topic: 1306 Message: 1306

I have started another yahoo group about the D700 & D7. This new group is dedicated to learning how to use the radio in the very congested Tampa APRS area.

It is>> FL-D700@yahoogroups.com

It is not ment to conflict with any other group, and anyone with APRS interest is welcome. I feel this group is needed to discuss the unusual circumstances encountered in the Tampa Florida area.

For what it is worth, this area is so congested that the "aloha circle" here is about 12 miles. The Aloha circle is a term that Bob Bruninga has coined to indicate the usable range for local APRS traffic.

It is based on several complicated metrics, but a good indicator is the distance to the most distant of 40 stations in your area. This can easily be deturmined by using the findu, nearest stations list, which just happens to include 40 stations. Scroll down to the bottom and check the distance to the last station. That is your "Aloha Circle" distance. This is the maximum distance for which your local network will provide good communication. It is not a hard and fast metric, but does give a good indication on network density. The term comes from the original aloha system developed in the early years of digital communications.

For a more indepth discussion of this and other problems of network density, google fix144.39 for Bob B's latest. It is on his website.

1314. Using AM/FM car antenna for APRS.

Yahoo group: APRS (1998 — 2006)
Date: 2003-12-13 19:11:37 UTC
From: Bruce & Leigh Coates
Topic: 1314 Message: 1314

Hi.

I'd like to try using the existing AM/FM car antenna for a built in tracker that I'm assembling. (I don't want to install another antenna for APRS). I know there would be issues around SWR and the efficiency of this length of antenna, but I'm concerned with that right now. (It's currently running on a rubber duck sitting on the back seat, so this would be an improvement) My real question is whether anyone has tried to build a duplexer that would allow you to use the antenna for both the AM/FM radio and the tracker. The tracker will put out about 6 watts on VHF.

What you are whatting to do is really not pratical. There are lots of mods that you would have to do to the factory am/fm antenna to use it as a tx antenna. But if you really what to do this I hi recommed that you contact Sti-CO. These folks make antenna that replace your am/fm antenna and let you tx thru it as well as still have a am/fm radio antenna at the same time. You didn't say what your car make and model was (they may or may not have what you are looking for) I have used these antennas for years on undercover police cars drug enforcement cars and so on. Now as with any custom app like this it will cost you we pay around $350.00 for the antennna and a coupler box for crown vics. SO if you really what to do this Sti-Co can most likely help you.

Good luck (and keep in mind that that 3/4" hole in your roof only stings for a few minutes and payoff last for years)

BTW the STI-CO with be a 1/4 wave and in some models you can get a dual band unit.

right now. (It's currently running on a rubber duck sitting on the
back seat, so this would be an improvement) My real question is
whether anyone has tried to build a duplexer that would allow you to
use the antenna for both the AM/FM radio and the tracker. The
tracker will put out about 6 watts on VHF.

Sounds like aprs is a gps or radio that transmits your location which
has lots of search and rescue uses is there a way you can get started?

Hi John a newbie myself only been on about a week with a 1270 and using
Winaprs, just download install and you will be up and
running this weekend! I also have my Peet 100 weather station
interfaced into it and working good. Next project is a one wire weather

station and a stand alone station based on the PIC16F877 microprocessor
that will be placed by my greenhouse (clearest place on
the property away from trees).

APRS: Automatic Packet/Position Reporting System.

Designed to provide real time tactical information, including position but also status, weather conditions, and short messages to users.

Data from computer terminal, GPS, weather station, etc, fed to a TNC (Terminal Node Controller, sort of like a modem for radios), transmitted , and then the reverse process takes place on the other end. Usually displayed as overlays on maps, but can be viewed as text data if needed. (Note: You do NOT need a GPS to play on APRS. It's not needed for fixed stations, you enter your position manually and forget it. Even for mobiles, you can always update your position manually. GPS if VERY nice, but not required)

Primarily used on amateur radio frequencies, specifically 144.390 MHz in the USA, as it was developed by Hams. There is some talk about using it on other services, but the legalities and practicality vary from service to service.

So the first thing to do would be to get an amateur radio license if you don't already have one. Check with a local club or see: http://www.arrl.org/ham radio.html

For information on APRS, start with "Mr APRS" himself, Bob Bruninga, WB4APR, the man that started it all back around 1992: www.aprs.org

There is software available for DOS, MAC, Linux, PALM, and several flavors of windows. Check out the Tuscon Amateur Packet Radio (TAPR) site at: http://www.tapr.org/

TAPR has links to all versions of the software.

Hope this helps

John,

It's possible they were thinking of the APRS friendly capabilities built into the KPC-3+ with the 8.2 firmware or better. Second serial port for GPS input while hooked to a computer, ability to take GPS input and act as a dumb tracker without a computer, digipeating functions, etc.

For a fixed home station, just about any TNC will do, as you don't need to run a GPS. I've used both the KPC-3+ and MFJ-1270 at home, and both work FB. I use the 1270 currently in the shack and reserve the KPC for mobile/portable operations.

From: Lake County SATERN
Topic: 1314 Message: 1320

Hey Bruce,

Have you thought of fabricating an angle mount for your
rubber duck that would mount it out of the way ? (INSIDE)
I would think that even the rubber duck mounted near
either the windscreen or rear window would be better
than the out of resonance AM/FM car radio antenna.

Depending on what vehicle you have, I'd try to find
perhaps some interior trim like the one that goes around
the rear window glass, and mount the angle under that,
then you could simply have the short rubberduck hanging
upside down from the top of the glass INSIDE the car.
And it would be a simple matter to disconnect the duck
from the BNC fitting and remove it if needed.

If the car is an older model that has a rear window
speaker deck (behind the rear seatbacks) (aka package tray)
then the rubber duck could be mounted there and it would be
tough to notice from outside the car at a glance, and I'm
thinking it would probably perform better than the non-
resonant array.

Remember that most car radio antenna cable is ~75 ohm.

I'm guessing you want to do this to negate drilling any
additional holes in the car ?

And here's an update and some background.

We have a '92 Ford Taurus sedan. We already have a VHF/UHF glass mount antenna on the rear window and it works just great. We use it with our mobile VHF radio. This rules out an interior antenna on the rear deck because it would be only inches from the antenna for the 50 watt voice radio. I might look at trying something on the dash if this doesn't work. Since the car is registered in my wife's name, she claims is as "her's". This pretty much rules out drilling any size of hole through anything ;-) .... ever ..... We also want to avoid the porcupine look of the typical ham car festooned with an antenna for every band .....

I received one reply about building a filter using quarter wave stubs made from coax. I built one up this afternoon and it works fairly well. There's still a small problem of the AM signals being coupled to the VHF radio causing a large drop in level for AM stations.

In short, it works but could use some fine tuning. Now to go for a drive to see how well it really works.

Hi
I am the 2m repeater manager in my hometown Drammen in Norway. I would like to connect a tnc to link the repeater input to the aprs frequency. Then we could use Mic-E on the repeater. I would like to know what kind of a tnc to use, if it needs special firmware and tips for the parameter setup. I have not seen any links on the web showing any practical solutions.

1332. Better DOS APRS maps?

Yahoo group: APRS (1998 — 2006)
Date: 2003-12-22 03:32:05 UTC
From: Jacob Tennant
Topic: 1332 Message: 1332

Where are the better/best maps for DOS APRS? Mainly looking for maps in the Morgantown,WV area as that is where I am located.

Reason is that I have a old 486 laptop available to me and was going to use it for a mobile setup, and past practice with using Win95/98 in a mobile enviroment in my beat-up old chevy truck I would rather just use a DOS based laptop so if the power to it dies I can just restart the system without all of the Win95/98 crap that it loads. Also machine has little ram so DOS would be faster that WinAPRS.

Also any advise on making my own DOS APRS maps would be great as with a cable modem file downloads are a snap.

This is the reply I got today from the maker of the USB TNC. Hopefully it will answer some of your questions.

Subject: RE: TNC - Request for product information

Dear Sir,

Thank you for e-mail.

We are under final tests phase. We will be very happy to offer you our product, as we will finalize our tests. More news (including manual) we will send you by the end of December. Final product is scheduled to be ready for sale by the mid/end of January. Price is 99,90 Euro. About your question, please find our answer below:

From one side there is an RJ45 with 8 pins:
- 2 pins are external power supply (optional) "+" and "GND"
- 2 pins is GPS receiver (tx and rx)
- 4 pins are Radio Interface (tx, rx, ptt, gnd)

Please note that GND is common also for GPS.

USB connector is dedicated for the computer interface (data receive and transmit). It is also used for battery charging. Battery could be also charged form the external power supply (optional). Battery are included in the same small box with TNC (and of course with the same introductory price), presented on the web page. So, you will have 8 cables coming out from the RJ45 side. This TNC, because batteries are already included, could work independently from power and computer. Could also work powered from USB or external power supply. Selection is done via software or automatically. You do not need to open your device for any reason.

Please do not hesitate to e-mail us with any questions.

With Kindest regards

Ioannis Mourtsiadis

Do yourself a real favor Alan and use "Digi_NED". It runs on a 286 with DOS and restarts automatically after a power bump. I've never had a crash in nearly a year of operation. The software is virtually idiot proof to use and I've catalogued all sorts of ARES related/useful information in the files. An "intelligent digi", it's running in wide mode with far fewer transmissions per hour that other digi's in the local region operating on other software. Best of all the software is free. Google search "Central Ontario District ARES" and follow the links to the "Digital" page for Digi_NED and other options. 73,

From: Ron Cluster
Topic: 1328 Message: 1338

There are a couple of ways with the KPC-3 plus.

Set it up like this:

http://www.nwaprs.org/widedigi.htm

and it will be a complete, stand-alone, RELAY, WIDEn-n, TRACEn-n digi.

Or, better since you said you are running this at your house, download and register UI-View32 (about $18 USD), run the TNC in KISS mode and UI-View32 will do all that plus give you the onscreen display. I was never successful running a digi with WinAPRS, other than just being a RELAY digi.

Please make sure that your area needs a full WIDE and TRACE digi at your location before you do this. RELAY is fine for just about anywhere, but redundant WIDE and TRACE digi's just increase the network traffic without any benefit.

1340. APRS and Palm Tungsten/e

Yahoo group: APRS (1998 — 2006)
Date: 2003-12-27 17:59:59 UTC
From: John Schneider
Topic: 1340 Message: 1340

I received a Palm Tungsten/e for Christmas and I cannot, for the life of me, find a compatible GPS unit.

Does anyone have experience with this Palm model and APRS/GPS ?

Thanks for your help.

John, KB2COP

1349. Balloon with APRS Payload

Yahoo group: APRS (1998 — 2006)
Date: 2004-01-05 18:10:46 UTC
From: Bob Bailey
Topic: 1349 Message: 1349

Saturday from EM-18 we will launch a balloon with an APRS beacon with GPS payload from Central Kansas. It will have the callsign WB0DRL-11 and will be on 144.34 MHz. The balloon is expected to follow the jet stream east from Kansas. The KA0MR-15 Igate will pipe into the Servers as long as it can see it. It is expected to be able to see the APRS for about 400 miles. We need some Igates in the eastern regions of the U.S. to switch thier recievers to 144.34 MHz if it possible to trak this via Internet APRS Servers.

The chase team will be on 7.155 MHz as well. It will launch in the morning of Saturday Jan 13 ,2004

You use this URL to get into the KA0MR-15 Igate to view it at:
http://63.245.178.206:14501

1350. Accessing PCSAT telemetry via the Internet.

Yahoo group: APRS (1998 — 2006)
Date: 2004-01-06 01:43:44 UTC
From: Bruce & Leigh Coates
Topic: 1350 Message: 1350

Hi.

I'm sure I'm just doing something wirng but I can get this to work. I want to have UI-View capture the telemetry packet from PCSAT-1 and PCSAT-11 via the Internet. I've configured the client to send the filter string "filter p/pcsat b/pcsat-1/pcsat-11 t/t". I've also tried "filter p/pcsat" and "filter b/pcsat-1/pcsat-11" as well as a few other variations. I've tried this string with each of the tier 2 servers (socal.aprs2.net, midwest.aprs2.net, etc) and even connected briefly to a couple or the core servers just to rule that out. I know I'm using the filtered port because other filter strings such as p/ve5 pass the appropriate packets. As yet I haven't recieved a single pcsat-1 or pcsat-11 packet other than the ones received directly from the satellite by my station.

Can someone point out where I;'ve gone wrong?

73 - Bruce - VE5BNC

1351. When do we get a Ham Rhino?

Yahoo group: APRS (1998 — 2006)
Date: 2004-01-06 03:56:51 UTC
From: Steve
Topic: 1351 Message: 1351

http://www.garmin.com/products/rino130/
The link above is to the page detailing the new Garmin Rino 130.
For those who are unfamiliar with the Rhino family of radios they
are combination FRS/GMRS portables which have built in GPS receivers
allowing users to plot their location. That location can then be
transmitted on the FRS channels to other users. The Garmin Rhinos
are really catching on in popularity with the many Search and Rescue
teams around the US who have tried them.
I know this has been brought up before but for the life of me I
can't understand why Kenwood or Icom or another big name radio
builder hasn't put out a simular radio transmitting 5 watts on the
2meter band. Sure we all know that kenwood had the TM-7D but it
still required attaching a separate GPS receiver and had no display
to observe and map other users locations.
Who here would not scrape together enough money to buy a dual band
portable incorporating the features found in the unliscensed Rhinos?
Why have the radio manufactorers failed to build such a useful
product?
Be safe,
Steve

> portable incorporating the features found in the unliscensed Rhinos?
> Why have the radio manufactorers failed to build such a useful
> product?

The most reasonable answer to the question is $$$. The Rhino is a relatively new comer to the radio spectrum. It's a good product designed for the consumer market, apart from amateur radio.

The Kenwood APRS talkie is a fine unit. I am sure there are those on this list who have them. I owned one once. However, I don't now.

A much more burning question is "Why have amateur radio operators, with their superior technological ability, not modified the Rhino to the 440 APRS channel and ported that to the 2m APRS channel?"

The answer to that question is the product is too new. It will come.

Let me know how more I can help.

1358. APRS waypoints on Garmin eMAP display

Yahoo group: APRS (1998 — 2006)
Date: 2004-01-06 21:16:23 UTC
From: Gene
Topic: 1358 Message: 1358

On a recent trip using my THD7A to monitor APRS activity and feeding the GPS input from a Garmin eMAP handheld GPS (NMEA 4800 baud), I noticed that whenever an APRS station was received on the THD7A, a corresponding waypoint symbol (small black square) was entered for the APRS station position on the eMAP display along with a label containing the last 6 characters of the callsign (truncates the leading characters if longer than 6 - i.e. WA1AAA-5 showed up as 1AAA-5; W1AW-1 would show complete call).

I didn't realize that the THD7A sent NMEA strings back to the GPS but undoubtably it does. Nice little feature to have as a simple APRS positioning display. When the data from the eMAP was downloaded to my laptop running Garmin Mapsource maps, the APRS waypoints all appeared where they were reported at.

Note for this to occur it does require a 3 wire hookup for TX and RX GPS data as shown in the THD7A manual.

I have been using a Garmin Emap with mine for a couple years and it works GREAT.. I also just helped a friend of mine hook his up to a new Emap he just got with excellent results.. Cheap way to get into it too. He was using one of those GPS units that doesn't have a display but it didn't work very good. Wouldn't lock up half the time, others was inaccurate..

1364. aprs map

Yahoo group: APRS (1998 — 2006)
Date: 2004-01-09 16:22:22 UTC
From: ve3fxq
Topic: 1364 Message: 1364

Greetings
My name is Larry, my call is ve3fxq...
When, I believe, aprs was more or less just starting out in amateur radio, midish 90's, we displayed it at the Canadian National Exhibition in Toronto, ve3cne....
We set it up on it's own 2 meter radio and, initially, there was not much wow appeal....
Later I saw maps forming on the international scale. On a few occasions I saw trucks with aprs traveling across the u.s.a....
I have been off aprs for a number of years now....Are there maps on the internet showing the extend that aprs has grown and maps showing me what I might see on my computer screen on with an international flavour?
Larry ve3fxq

From: Ron Cluster
Topic: 1364 Message: 1365

Oh boy are you in for a surprise.....

UI-View32 has a built-in Webserver and many users around the globe are making their webpages available on the net. Go to the UI-Webserver web-ring listed below and take a look.

http://www.ringsurf.com/netring?ring=UIWebserver;action=list

UI-View's home is at http://www.ui-view.com/

There are many more resources for APRS. Here's a couple:

http://www.nwaprs.org (A very good reference site)
http://www.aprs.net/ (This one is a live APRS feed via JAVA. You pick the area)

73.....Ron.....AC7TK.....(-9 when mobile)

Subject: [APRS] aprs map

Greetings
My name is Larry, my call is ve3fxq...
When, I believe, aprs was more or less just starting out in amateur radio, midish 90's, we displayed it at the Canadian National Exhibition in Toronto, ve3cne....
We set it up on it's own 2 meter radio and, initially, there was not much wow appeal....
Later I saw maps forming on the international scale. On a few occasions I saw trucks with aprs traveling across the u.s.a....
I have been off aprs for a number of years now....Are there maps on the internet showing the extend that aprs has grown and maps showing me what I might see on my computer screen on with an international flavour?
Larry ve3fxq

I am located in Springfield, IL. I will have an
i-gate here listening plus a few other APRS stations.

Are you going to have any video feed? A local sstv
ham is interested.

I will be at our club station listening on 7.155 and
will have the APRS station on 144.34 listening for any
packets should it come our way.

Any links to this launch would be appriciated. I
cannot find any.

I don't know anything about the D700, but there is
also another device from Australia called the
Antitracker which will write waypoints to a gps when
it hears the aprs audio from a reciever.

1370. The perfect partner

Yahoo group: APRS (1998 — 2006)
Date: 2004-01-10 09:30:15 UTC
From: mary mary
Topic: 1370 Message: 1370

Dear:

Some of us go to the extreme in deciding whether someone is right or wrong for us. We are all individuals, with different opinions, philosophies, political beliefs, hobbies, musical tastes, and habits...

Some of the differences between you and your potential partner may actually be advantageous to building a stronger, loving relationship between you.

Instead of seeking the "perfect" partner, you need to seek a partner who is right for you. Without putting in the work, even the most perfectly matched couple's relationship will eventually fade. Some of us go from relationship to relationship, hoping to find "the perfect one," only to find ourselves, down the road in another relationship, missing an old partner whom we now recognize, in our heart of hearts, was the right one for us.

Dan-
The first source most likely of Igate will be KAØMR-15 at
http://63.245.178.206:14501

It is my Igate feed for KAØMR Digi that is located 4 miles away on a 150 ft grain elevator but I only have 144.39 on it so I resorted to a verticle on my 120 ft tower here at the house and tuned the recieve to 144.34 and transmit on 144.39 that way it will feed into the Internet Servers and will go out here locally WIDE3-3 at KAØMR Digi and out.

Hope it works. I will also in the chase vehicle split frequency as well and set to digipeat from car as i should be in view of balloon most of the time and will most likely propagate from chase car aout WIDE5-5 and hit an Igate somewhere as balloon most likely will be in view of Kansas City, MO.

Also look on www.findu.com fro WDØDRL-11 the cahse car is KAØMR-9

Bob KAØMR

I forgot to answer. As far as I know there is no ATV on this one. As a matter of fact Pete was having trouble today with GPS and APRS interfering with one another and was trying to isolate it. If he can't it will be scrubbed. I will send a bulletin out about 5:30 CST on the APRS Servers as the stataus.
Call us on 7.155 if you hear us.

Thanks for particpating with us.
Bob KAØMR
P.S. I am involved in ATV on 434.000.

I have no idea why but your message dated Jan 9 just showed up from APRS@yahoogroups.com. I get them via yahoo email so something was stuck somewere.

I never did see WD0DRL-11 on the KA0MR-15 Igate. I am told by my son that the reason is that the strings from WD0DRL-11 did not have valid checksums. It did not show positions on my local APRS+SA however my Igate updates did show on findu.

Topic: 1349 Message: 1374

Same here Ron. Bob's replys from the 9th just showed
up also. Stuff happens.

Thanks Bob for that info. You gives me a few ideas
fon using APRS on some events in our local area.

I had a great time following this event. I was at our
Red Cross station W9DUA with a few fellow HAMs here in
Springfield, IL, listening to 40 meters (checked into
the net) and had an i-gate filter the ballons packets
out locally on RF so we were able to watch it's treck
real-time. I stayed for the entire event listening
and watching.

My home station I had on .34 with what I thought was
my 5 element beam, but was on my 6dB gain mag mount up
30'. I wanted to see if it would see the ballon
directly. It started decoding packets 363 miles out
at 112758' until it's decent. Last packet was 285
miles out at 17265'. It copied 204 packets from 1356
to 1539.

What was the "beep" for at the end of its beacons???

Great event. Reminded me of listening to the Mars
rover last week and of the Mars Pathfinder entries.
Great job everyone!

So for the big question....What happened to the
3000g's payload???

HI Kevin
You got all the stuff needed execpt some software.
I recommend UI-View for home as it is the easiest to use
and there is a lot of plugins.
I think that there is a program called aprsCE that you could use with
the IPAQ.

That is what I would use and I´m sure you will get a lot of other
suggestions.

Welcome to APRS

APRS/CE will work great on the Ipaq. I use it on a Compag Aero 2180 (predecessor to Ipaq) and it is just fine. You will need to get a map (s) for your area of coverage. Check the PocketAPRS website or TAPR website for these. They are free to download.

In addition to your list of equipment shown, you will need a 'Null Modem' for connecting the Ipaq serial cable to the TNC serial I/O port. The Ipaq serial port is configured as a DCE device and the TNC serial port is also a DCE device. A source for null modems is Radio Shack (p/n 26-264 for DB-9 to DB-9 version appx $7 US). That's all there is to it.

Good Luck

Any GPS that spits out NMEA-0183 sentences should work fine. Any reputable dealer of GPS equipment SHOULD know what you mean by NMEA data. If not, find another dealer.

There is NO excuse for a dealer not to know about the items he or she is selling. That is just pure laziness on their part. It takes every bit of a couple of hours to read the user's manual and look up unknown words or terms to familiarize ones self with the top level features of a device. We're not talking rocket science here!!!!!

Good Luck

Martin,

A users manual was included in the box with the radio (or available online from www.kenwood.net) that when actually opened to page 10, the connections for hooking up a GPS to the TMD-700A are shown.

Refer to the connection pinout from the GPS to be used and match up the signals. If using an eMAP, use the eMAP serial cable and build the cable from page 10 as mentioned and your in business.

Set the eMAP to interface using NMEA 4800 baud instead of GARMIN and hook up the cables. You will also need to setup the radio to operate APRS. SEE MANUAL!

Good Luck

I stand corrected. After rereading the manual, I found where it
states that this actually will occur. Guess I overlooked that
paragraph previously.

Have your friend download and register UI-View32 (about $18 USD)

PM6 integrates perfectly with UI-View32 and it's a far better program.

1392. APRS wiith DELL AXIM ?

Yahoo group: APRS (1998 — 2006)
Date: 2004-01-27 08:53:49 UTC
From: Bela Markus
Topic: 1392 Message: 1392

Hi,

I have a DELL AXIM 5 PDA with a PCMCIA card GPS receiver. Is it possible to use for position sending with ordinary TCVR using the sound output? Receive is not so importand but would be good too. Do not want to buy an APRS radio or carry TNC.

Regards... B?la, HA5DI

1393. Re: Garmin to AutoCad

Yahoo group: APRS (1998 — 2006)
Date: 2004-01-27 17:34:28 UTC
From: Broncus
Topic: 1388 Message: 1393

Greetings,

I send data tracks to AutoCAD 14 myself. My process is as follows:

1. Import test file into Excel.
2. Strip out extra data and move longitude(x) to column A and latitude (y) to column B
a. set # to right of decimal to 8.
3. Save as a text file.
4. Open file with Wordpad.
5. Convert all TABS to COMMAS (Excel saves test file with TABS)
6. Add a first line of 'line'.
7. Save file as filename.SCR.
8. Open AutoCAD and run script filename.SCR.
a. Make sure OSNAP is off.
b. The script file will draw lines between each point in the list.
c. If you scale the altitude, you can display it as well.
i. Make Altitude the z value.
ii. Scaling is something like altitude/1000.

Example of filename.SCR:
line
-71.50657330,42.99811830
-71.50680330,42.99802170
-71.50699830,42.99800670
-71.50723000,42.99799500
-71.50747330,42.99798500

I used my Palm IIIxe to save the tracks. you will need to find something to do the same. I save a point every 1 second for awhile, thn changed to every 30 feet.

I did a bunch of tracks this way and have produced a map of everywhere I have driven within about 6 months. It is preety cool to view. the file is now in the range of 7 Meg.

Best regards,
Fred

DOS APRS should work FB on it. I've used it on 286 and 2 Mb ram. Just make sure you have an operational serial port for the TNC connection.

See TAPR.org for download.

Hope this helps,

From: Gene
Topic: 1400 Message: 1402

I believe you won't be able to use the round mouse port for the GPS as this is a PS/2 style miniport for the mouse and will not communicate as a std RS-232 serial port to the GPS as is. It might be capable of doing so if you were to write a device driver to allow the communications to take place between the GPS and the PC doing the translation in the PC software.

From: Phil Reed
Topic: 1407 Message: 1408

No, it's not really possible. One important function the TNC does is essentially a modem -- converts binary data into sound for transmission over the radio. Another is to handle the AX.25 protocol, which are the bytes surrounding the data to tell everybody else what to do with the data.

While you do need something, it doesn't have to be a full TNC. You could use a Tiny Trak (see http://www.byonics.com/) which does just enough to handle the transmit side of things. You'd still need a TNC on the receiver, though.

You do NOT need a TNC if you have a computer/laptop with a soundcard.
You can use the SV2AGW software that will do 1200 baud packet for APRS ,
it does it quite well.

1410. Tiny TNC

Yahoo group: APRS (1998 — 2006)
Date: 2004-02-12 22:22:52 UTC
From: Barry Bogart
Topic: 1410 Message: 1410

Well, you can use a TinyTrak! I supose that qualifies
as a TNC, but it is a pretty cheap and tiny solution.
But it will just transmit your location - not receive
anything. But maybe that is good enough for your app.

73, Barry

1411. Following your track.....

Yahoo group: APRS (1998 — 2006)
Date: 2004-02-12 22:54:44 UTC
From: cworksmidwest
Topic: 1411 Message: 1411

Hey group,

I have a question. I'm thinking about putting an aprs tracker on my snowmobile to see where I've been. However, looking at findu.com onlu gives me the current position. I had a node set up here using DOSAPRS 848 but knowing the graphics just cannot not get detailed enough for tracking my snowmobile through all the turns on the trail... plus it does not have any of the county roads on the map, onlt the interstates.

Is there any software that could be used to track my snowmobile using a downloadable map... like from mapquest ... so I have a detailed track?

Basically I want to see "bread crumbs" of where I've been on the trails.

Thanks

Dave

UI-View will do what you want.

You can download Topo, aerial photos, street maps, others. It integrates seamlessly with Precision Mapping as well. You will want to look at the free add-on UI-Height or UI-HeightTrack I can't remember which off-hand. That will let you do the bread-crumb feature you need.

UI-View32 with the UI-Route plugin will do that. UI-View32 can also create a logfile for a specific callsign that you can save and playback later.

If you are in the US, Precision Maps from Undertow Software cannot be beat.

APRS+SA will talk to Street Atlas, so you get all the streets in Street Atlas (be sure to check -- I think Delorme changed their interface, making APRS+SA break when using more current versions).

Also, remember that Findu will only provide your location if you tracker gets picked up (directly or indirectly via RELAY/WIDE) by a station that is part of the APRS Internet infrastructure. If you're out of range of an Internet-connected APRS station, you won't appear on Findu no matter what.

I suppose you could run a laptop and radio in a car, using that to record your off-road track (if you stay within a few miles of your car, anyway).

Thanks to all for the suggestions. My idea is to keep everything as small as possible because of limited space in my Ford Focus. The only thing I want to be able to see is the handheld GPS unit for when I am driving around. Then my buddies can track us on the internet when we go DFing for interference signals. I even have plans to test a covert antenna installation! I'm not so sure if it will be effective for long range VHF, but it's always fun to try something different than the norm. 73

1416. Tracks on maps

Yahoo group: APRS (1998 — 2006)
Date: 2004-02-13 23:59:56 UTC
From: Barry Bogart
Topic: 1416 Message: 1416

I use Fugawi mapping software for that . It just
uploads the track from the etrex and plots it out. It
does elevation profiles too.

But I thought that Findu DID have a breadcrumb track
somewhere....

Yes, if all you want to do is transmit your position, a Tiny Track will
work fine in place of a full TNC.

Hi all.

I have jsut joined the group and am not sure if I should post this reply here but I will see how I go.

I am currently writing some software that logs into an internet APRS server and grabs the APRS packets. I am using it myself to do what you are after. I am just at the moment adding the display of units on maps. I am intending to import the maps that are used in UI view since I have the ones I need already but basically you can use any scanned map image and calibrate it.

If user can see any use for it I can modify it to watch for particular callsigns etc and log the data to files....

Ask for more info but for now I will see how this message is recieved.

Regards, Peter

1422. 6 meter APRS Standard Frequency

Yahoo group: APRS (1998 — 2006)
Date: 2004-02-14 23:15:40 UTC
From: kd7lmo
Topic: 1422 Message: 1422

Is there a common or national APRS frequency for the 6 meter band
(similar to 144.390 and 445.925 on 2m and 70cm)?

Are there any digipeaters located in the 6m band?

Thanks

Andy

Isn't this a KISS mode TNC, and thus wouldn't it require a PC to be connected to it to function? I think the original post was for a device which would be stand alone, such as the TinyTrak3.

UI-View can already create a logfile from any specified callsign. You can play it back within UI-View or use it elsewhere. It's just a simple textfile.

Hi all.

Then Dave is set then. I am only writing some stuff for myself as I need extra bits and pieces that are not in UI view and also because I like to tinker..

I should probably sit down and have a good look at UI and see what it can do. One of the things I am using my stuff for is alarms when no movement or nothing is heard from a field unit....

Thanks Ron and all. I think I will enjoy this list very much.

1428. Please trim followup messages

Yahoo group: APRS (1998 — 2006)
Date: 2004-02-17 13:45:26 UTC
From: Joe
Topic: 1428 Message: 1428

Please remember cut the unnecessary included text from your replies before sending them to the group. Especially for readers who subscribe in digest mode, messages consisting of three new lines of text attached to a bunch of other prior messages with footers and so on are extremely difficult and annoying to read. Just include enough of the prior content to establish the context for your new comments.

Thanks!

-joe

Hello Joe,

Would please review my account and turn off the email.

I have closed my account with APRS group but I still am getting email....

Regards

Doug

1434. 6 meter APRS Standard Frequency

Yahoo group: APRS (1998 — 2006)
Date: 2004-02-18 06:22:19 UTC
From: kd7lmo
Topic: 1422 Message: 1434

Is there a common or national APRS frequency for the 6 meter band
(similar to 144.390 and 445.925 on 2m and 70cm)?

Are there any digipeaters located in the 6m band?

Thanks

I went through the process, skeptical but using bogus phone, real shipping
address, and junk-willing-email address. The confirmation email address had
https addresses in it.

Basically, I didn't give them anything like credit card or financial info.
Seems legit so far

I beg to differ.

ASP does not "have its own security." ASP is just another server-side scripting language framework like PHP or ColdFusion, and is no more inherently secure than anything else on the web. All ASP does is dynamically build the HTML that gets delivered to your browser when you send a request to the web server.

HTTPS encryption security for web traffic is provided by SSL security certificates, which allow for the server (software or hardware) and your client to encrypt and decrypt data at each end so that the content isn't passed as plain text.

If you go through the MS order process above you'll find that when they get to the point of asking for your address, you have been redirected to a secure server which does use SSL encryption, and your address is passed in encrypted format when you submit it.

Brad,

Any GPS unit that has the capability to output NMEA-0183 data sentences should work provided you can power it in the intended environment. You would not want to use a battery powered only device in a mobile setup as it would be a problem to constantly change batteries, but if you supply a 12V to GPS (??) voltage convertor, then your all set. MOst GPS units work on one of three voltages, these being 3V, 5V or 12V. It is easy to build a 12V to ?? convertor for a GPS unit.

Most of the current GPS models can do the NMEA sentences but check the user manual, company website or ask the saleman (but only if they actually know how the read - some seem like they don't know or care how the product works - just buy it and be off).

I use a Garmin eMAP, a DeLorme Tripmate (converted to self start) and a Deleuo (sp?) mouse type in several different applications for APRS.

From: Brad Heaton
Topic: 1449 Message: 1450

You don't specify which cables you are wanting. The serial are simply 2.5mm stereo plugs. I ordered the molded cable assemblies from mouser. See http://www.mouser.com/catalog/617/593.pdf <http://www.mouser.com/catalog/617/593.pdf> Look at the 'D' parts. You will need to home-brew the other ends. I used DB9 plugs (Male or Female depending on what I was connecting to) and they work fine.

If you are looking for power cords, check page 594: http://www.mouser.com/catalog/617/594.pdf <http://www.mouser.com/catalog/617/594.pdf> . Not sure what size. I haven't bought them.

If you have any other questions let us know.

Subject: [APRS] Question

Is there standard format number system that is used with APRS? What I mean is I see call signs on my screen that have K6SUD-(number). I use 1 for my truck and 2 for a laptop, etc. Is there a format I should follow or is everyone just doing thier own thing?

Thanks

Hi Jim
Don't know about the Magellin but I do know not all
Garmin will work, so be careful. I have on e-aby a
Garmin Street Pilot 3 that will work. just in case
your interested. Bob K4BFD

1460. RE: [APRS] Magellan GPS

Yahoo group: APRS (1998 — 2006)
Date: 2004-03-02 22:34:18 UTC
From: Ian Snow
Topic: 1456 Message: 1460

Any Magellan unit with a memory/PC cable capability can be used to "drive" either the D-700, D7A or laptop program. As a retail salesman marketing four lines of equipment Magellan would not be MY first choice based on ratio of warranty returns. Be very careful about fully compressing the base spring first when inserting batteries (the clips break off the board easily) and if it's an initial purchase DON'T update the firmware from the bundled disk, to the website. Too many people don't READ the manual first, don't realize the default unit is NOT the one they purchased, and wipe out the firmware. It can only be reset at manufacturer level. My now 4-year old E-Map with miniscule memory solders on without incident.

From: w5mik
Topic: 1461 Message: 1461

I use ui-view32+SA as a local map for monitoring local aprs stations. My question is when I click on an aprs mobile station,some will show speed, direction of travel, elevation and position. Other stations will show only position. Why is this? Is it the type of tracking devices being used by the vehicles, or it the software be used by a particular Digi that received the beacon? I really like the ones that display all information. I use a Tigertrak TM-1 and it only displays position on my local map. Thinking of upgrading but want to gather facts before purchasing.
Thanks

Hi Jim...

I would have to echo the "Caution" notice with regards to the
Magellin products. I have had success with Magellin, Lowrance and
Garmin GPS units and I must say that the Garmin units by far are the
most compatible and reliable.

My present APRS station consists of a D7A(G) and a Garmin GPS V.
I'm very happy with this small package. Although not necessary, I
prefer the "moving map" display types over the data only types. The
GPS V allows me to display other APRS stations around or near me.
Which is handy when traveling...

73 and good luck...

The mobile station has to be using a GPS string that has that info in it AND they have to be using a TNC device capable of encoding that info.

The digi's don't (or at least shouldn't) change that info.

W8Aii-
<<The GPS V allows me to display other APRS stations around or near me.
Which is handy when traveling...>>

Is that from the Kenwood's function to send out APRS stations as waypoints?
The Garmin's can just pick them up from the internal waypoint lists &
display them then, or what is needed on the GPS side?

My older Garmin 12XL has a problem in that area, some data exchanges have
to be done in "Garmin/Garmin" mode and others in NMEA/NMEA mode, I was
wondering if the new Garmins fixed this and allowed everything to be done in
NMEA mode now?

My understanding is that that'll work if your Garmin accepts GPWPL NMEA sentences. I think the older Garmin receivers don't, but the newer ones do. The Kenwood TH-D7A(g) sends that sentence automatically.

From: bergweed
Topic: 1471 Message: 1471

Hi group,
I've been a registered APRS user running WinAPRS on a Windows 98 platform for years. I recently upgraded to Windows XP on this computer and can no longer get connected to any of the APRS servers.
I've noticed the aprsserv.txt file looks a lot different when I view it with notepad than I remember it to be.
I've tried editing it to include the same servers I had before, but I always get a TCP failed message now when I try to connect.
All of the other Internet programs (explorer, email etc) work fine.
73,
Mike N0QBH

Too make it a even hat-trick, I will also advise to go with a Garmin. I use a eMap and it works superbly. Not one problem and is very simple to setup and use. I have even go to the point of being able to operate it with one hand using my thumb to control the 'joystick pad'.

Also with the eMAP you can use replaceable memory cartridges (of course they're Garmin proprietary but we can't have everything in life) to load maps on. I have a collection of these memory modules and have loaded my most common maps on them so I can switch coverage areas in a couple of minutes, without any tools I might add.

Good Luck

Problem solved:
I might also add that I upgraded WinAPRS versions at the same time which is what really turned out to be the culprit. It seems the aprsserv.txt file that is included with the newer versions doesn't like to be edited by mere mortals as myself. However, the older versions (i.e. 2.46) have a file named as aprsserve.txt (note the "e") which does lend itself to being edited. I was able to download an old version from the TAPR site and grab the aprsserve file, copy it into the new version, edit it and viola, it worked!
Does anyone know why they changed this in the newer versions?
I looked at the docs and didn't see any mention of this either.

I just ran into this Sunday, had to resolder my cable because with RS-232's and devices SOMEthing is always reversed on the first try. You can't do any harm by getting the RX/TX wires reversed, don't worry about it. The TX wire from any NMEA device will produce a regular data pulse that you can pick up on a multimeter, set for lowest volt scale. If in doubt, turn on the Garmin, make sure it is set for 4800/n/8/1 and NMEA modes, and then use a multimeter from the ground cable to the one you suspect is TX from the Garmin. If there's no pulsing on it (the voltage level doesn't matter, a DMM won't catch it accurately anyway but it will show regular pulses) try the other lead.

In the worst case just solder up your "best guess" following whichever docs you have, and you'll have to reverse the RX/TX leads on one side on the connection.

FWIW, the GPS cable from the Kenwood will end in a DB9-M to mate with the DB9-F form the GPS. But a "computer" cable for the Kenwood would use a DB-9F, and have pins 2 & 3 reversed by comparison. You need to different cables (or one cable and a tiny gender changer/null modem adapter) for full function of both.

I did get it to work (at least part way) for me, although I know virtually nothing about electronics. The connections I tried are Kenwood red to Garmin white, white to yellow, and bare to black. It works part way in that the Kenwood is receiving data from the GPS. What isn't working is the Kenwood sending received GPS data to the GPS receiver to create waypoints (I did turn on the Waypoint feature on the Kenwood). I presume that I have a couple of the wire pairs wrong, but I haven't fiddled with it any more.

Yes the eMAP will display the position of recv'd stations providing
the have a valid position sent in the APRS data. It shows up as a
small black square next to the station call as a label (but only
displays last 6 chars of call - 'ki6lo-10' would show up as '6lo-10'

You have to use both the RX and TX signals from the radios GPS port.

Why guess when the wiring diagram is shown clearly in the eTrex Legend manual on page 58? The Green wire is data in, the White wire is data out, and the Black wire is Ground. If you don't have a manual, it is available on the Garmin website.

Subject: [APRS] Re: need assistance with garmin etrex legend connected to th-d7ag

I just ran into this Sunday, had to resolder my cable because with RS-232's and devices SOMEthing is always reversed on the first try. You can't do any harm by getting the RX/TX wires reversed, don't worry about it. The TX wire from any NMEA device will produce a regular data pulse that you can pick up on a multimeter, set for lowest volt scale. If in doubt, turn on the Garmin, make sure it is set for 4800/n/8/1 and NMEA modes, and then use a multimeter from the ground cable to the one you suspect is TX from the Garmin. If there's no pulsing on it (the voltage level doesn't matter, a DMM won't catch it accurately anyway but it will show regular pulses) try the other lead.

In the worst case just solder up your "best guess" following whichever docs you have, and you'll have to reverse the RX/TX leads on one side on the connection.

FWIW, the GPS cable from the Kenwood will end in a DB9-M to mate with the DB9-F form the GPS. But a "computer" cable for the Kenwood would use a DB-9F, and have pins 2 & 3 reversed by comparison. You need to different cables (or one cable and a tiny gender changer/null modem adapter) for full function of both.

Thanks, Dick!! for the information... ok, now on the kenwood wire, I
got 3 wires, white(rxd on gps) red (txd on gps) and shield (gnd on
gps).

Kenwood Garmin bare Wire

White - red

Red - white

Shield - Black

By using the above is this configuration above correct..

Thanks

Maybe. The colors you show for the Garmin are not the colors shown in the eTrex Legend manual. If you have an ohmmeter, you can check your Garmin cable. The third connector contact from the cable is the RXD (actually power is at the very end). The next contact back toward the cable is TXD. The closest contact to the cable is GND.

Always remember that the RXD on one unit goes to the TXD on the other unit, and visa-versa.

Assuming the white and black wires in your cable are the same as the one's shown in the manual, then that would leave the red wire in your cable as a substitute for the green wire shown in the manual. I would wire it up as you have shown and try it. You won't blow anything up if the red and white wires are reversed. If they are, just change them and you are in business.

1488. GPS Waypoint Behavior

Yahoo group: APRS (1998 — 2006)
Date: 2004-03-12 18:13:49 UTC
From: skagitjim
Topic: 1488 Message: 1488

I recently started eavesdropping on APRS broadcasts (don't have a license yet, so I'm not sending out). It has been fun watching packets come in, then look at them on the connected GPS unit.

I have noticed an interesting behavior on the GPS side of things when it comes to multiple packets with the same call sign (but with different GPS data):

1. sometimes the GPS unit simply moves the existing waypoint (named with the call sign) to the new location

2. other times it creates new waypoints for each packet, but appends a consecutive number to the end of the name (for example, I get a packet from Kxnxx and the GPS unit creates a waypoint with Kxnxx as the name; later I get another packet from Kxnxx with different GPS data and the GPS unit creates a new waypoint called "Kxnxx 1"; the next one after that will be "Kxnxx 2".)

I'm assuming that the GPS receiver is causing this to happen and not the radio (Kenwood TH-D7Ag), and as far as I'm aware all the settings were the same in both cases. At some point, I thought that I may have found the difference (whether the GPS unit was receiving from satellites or not), but some testing showed that it didn't make a difference.

I can see advantages to each behavior, but I don't know what's controling it. Anybody else notice this or have any ideas of the cause?

Jim

1489. DRSI TNC Manual

Date: 2004-03-13 20:37:52 UTC
From: Mike Rhoden
Topic: 1491 Message: 1492

The TM-1 is a tracker only, it is used in place of a tnc. I don't think it can be used as a tnc. I use one in my truck. Its not required to use software other than to intially set hardware. I've had mine for about two years now. Works very good as a stand alone. Kind of finicky though, the audio level has to be set different from the factory setting. I use ui-view32 for my base aprs station with a MFJ-1270C tnc & MFJ-8621 data radio. This combination requires no radio interface guessing. The interface cable from MFJ is already wired for this cmfiguration. Remember the TM-1 is only for data packets, the TM-1+ is for the other functions.(i.e. weather,tele.ect.)

1495. Etrex Waypoint Mapping

Yahoo group: APRS (1998 — 2006)
Date: 2004-03-17 14:15:32 UTC
From: Vince Staffo
Topic: 1495 Message: 1495

I just got a Etrex basic unit (yellow) and I am quite impressed with what it does! My use for the unit will be as a tracker for Amateur Radio and position reports!

My question has to do with the downloading of the waypoints and making them into a map! I have installed EasyGPS and have it working with my Etrex! Is there a way to display all the waypoints on the map to show a track or route of where I have been? Or do I have to use some other software? EasyGPS seems to only display one waypoint at a time.

Thank You,

Vince WB2FYZ

1496. APRS under Virtual PC on a Macintosh ??

Yahoo group: APRS (1998 — 2006)

From: Ron Cluster
Topic: 1496 Message: 1496

Is anybody running any Windows APRS software on a Macintosh under Virtual PC?

Specifically what I am thinking of trying is UI-View32 - Precision Mapping - under Windows 2000 Pro on Virtual PC - on a Mac OS X G4 Powerbook. The only piece of the puzzle I don't have yet is the G4 laptop. And I want to make sure this will work before I go buy one.

Experiences with other Windows APRS programs under Virtual PC on Mac OS X are also welcome.

Thanks for the input,

From: Mike Morris WA6ILQ
Topic: 1496 Message: 1497

This is not APRS-specific, but it may be relevant.

In my opinion, Virtual PC is a good program.

I was working at NASA-JPL in Pasadena, Calif. back when
a Mac G3-266mhz was the bleeding edge in Mac hardware.
At the time JPL's desktop end-user community was about
70% PC, 20% Mac and 10% unix (I'm not including the
project scientist's workstations or servers - they were on
another network). My spies tell me things have changed
since, the PC count is lower and the mac and unix count
is higher.
We needed a way to have Macs and Unix systems talk to
an Oracle based business applications system running on
NT servers. One of the options we tested was Virtual PC
running NT running the PC application.

After all the assigned tests were completed we had the use
of the hardware for a couple more months so as an additional
test we ran NT 4 Server for a couple of weeks... it worked very
well as a server for a group of 30 busy PC clients with the
performance about the same of a Pentium 200 running NT Server.
The end-user PCs never knew they were talking to a Mac.

Unless VPC has dropped in quality since then (which I
doubt) I think you will be happy with it.

1498. Virtual PC

Yahoo group: APRS (1998 — 2006)
Date: 2004-03-18 16:15:20 UTC
From: KC2MMi
Topic: 1498 Message: 1498

<Unless VPC has dropped in quality since then (which I
doubt) I think you will be happy with it.>

One important note: Microsoft bought VPC last year. I'm guessing that this
is because it was cheaper to buy it than to keep licensing it for the
development teams, who were (and are) running "virtual networks" with new MS
servers (plural) OS and multiple workstations all on the same Windows
laptop.<G>

It is quite slick to see one laptop emulating an entire network with
multiple servers all in one box courtesy of VPC.

But MS has also officially dropped all Mac support. The product still works
with the Mac, but there is no more vendor support for it, as far as I know.

1499. KPC3(not +) and RS digitraveller

Yahoo group: APRS (1998 — 2006)
Date: 2004-03-19 16:55:51 UTC
From: blosbd1
Topic: 1499 Message: 1499

I am new to the group, tried to find an answer by reading thru the posted messages already.

I have a KPC3(not+) with 8.2, a RS Digitraveller and of course a laptop. I would like to be able to use all 3 together with either WinAPRS or UI-view software. Obviously 1 serial port on the KPC3 so the data coming from the GPS would have to be shared between it and the computer. Has anyone done that or do I have to run 2 seperate setups? Intention is to track myself and others as well as use the KPC3 as a mobile APRS digipeter.

I am heading up a group of hamns for our local MS 150 bicycle tour and hoping to have APRS in all the SAG vehicles to help with seperation of units along the route.

Thanks for any input, I will try to give feedback to the group if I get it going...

Dean-
I don't know about your KPC3, but if it only LISTENS on that one serial port, all you need is a "Y" cable. In NMEA jargon, the GPS is configured as a "talker", that is, it only "talks" on the NMEA bus. (Which is the same as the RS-232 bus for purposes here.) One talker usually has enough power to connect to two "listeners" on the same bus, so if the computer and the KPC3 are both simply listening for the GPS in their serial ports, one "Y" cable is all you should need. You can start out with one cable that works connecting the GPS to the laptop, verify that it works, then add the "y" split with a second DB9F wired up the same way as the DB9F that plugs into the laptop.

This doesn't mean the PC can't transmit back to the GPS, etc., only that for normal operation someone needs to be sure only one device is "allowed" to be talking at any one time. That way there are no collision./sharing problems on the cable and nothing more sophi$ticated is needed.

I would recommend going to www.ui-view.com and looking at UI-View before you register.

The 16 bit version is free and the 32 bit version (UI-View32) is about $17 to register. Links to register are on that website.

I have been very much happier with UI-View32 than the $60 program, which I used for a couple of years.

OK, I'm not the smartest cookie around but this has me stumped. I am running a TH-D7AG with a Garmin GPS III+. The radio is picking up my GPS data. I have the TNC on, the Beacon on and set to auto. I see the transmitter key up, but there is no trace of my signal when I try FINDU. There is a relay digipeter 4 miles away from my location. I NEED HELP!!!

Do you hear two beeps, and see "My Position" at the bottom of the screen a little bit after the D7 transmits? If not, you are probably not reaching the digipeater. You don't need to look at Findu.com. Your D7 will tell you. Try another antenna. I had exactly the same problem with my D7 and the stock antenna.

I can only assume that both the D7 and the GPS III+ are both set to NEMA? And you have your call sign entered?

You could also set the D7 location #1 to your coordinates (menu 2-4), and set to Not Used (menu 2-2). Then you can eliminate the GPS III+ setup as a problem. Once you are sure you are reaching the digipeater with the D7 alone, then plug the GPS back in, change the settings, and try them together.

Remember that, with APRS, you can't get away with a mediocre signal like you can with a voice repeater. It takes a strong signal to send a perfect packet. Even though I can see the mountain a few miles away where our local digipeater is located, I have to be outside, holding the D7 between the mountain and me, and using a good antenna before I can send a valid packet.

Thanks for the replys.

My path is set to relay,wide.

No I do not hear two beeps and nothing is displayed. I did not realize it would transmit my data back to me. So that says I am not reaching the digipeter.

I will unhook the GPS and try the my position option.

Thanks, Dick and Shawn for the info.

Richard, I don't get any acknowledgement back from a digipeater when I'm just sending a beacon. The manual says there will be an ACK when sending a MESSAGE--but nothing about getting one if only beacon mode is used.

Am I missing something here?

The book, on page 4, states, "When you receive APRS data that you transmitted, the frequency display is not interrupted. 'MY POSITION' will appear at the bottom of the display....."

I just went outside and turned it on. The message "MY POSITION" comes up every time a beacon is sent. I am not transmitting any messages.

These comments apply to the TH-D7A(G) model and the Enhanced Features manual.

Thanks, Dick. So the radio will beep when it hears its own call coming back to it...that doesn't mean he's reaching the digi, the problem could still be either that he's not reaching it, or that it is set up not to locally repeat the stations it receives locally. (Stranger things happen, right?<G>)

I've found in an urban area the tx range can be less than 1/2 mile for the D7. Four miles away from the nearest digi, it won't find me except for a rare Twilight Zone Moment.

FWIW.

It's not hearing its own call coming back. It is receiving a position report, which in this case is your own. That DOES mean that a valid packet has reached the digi. The proof of the pudding, so to speak. If you don't get the (blinking) MY POSITION back, you are definitely not reaching the digi with a valid packet. This will be true whether or not you are using a GPS with the D7. I just took my D7 outside with a Digitraveler attached, and the MY POSITION came up every time the beacon was sent. Consistently.

If you read my previous post about antennas, I would agree with you if you are using the stock D7 antenna. It's basically worthless for APRS work unless you are right on top of the digi. Mine has been retired.

Date: 2004-03-25 01:00:18 UTC
From: A. Wesley Jones
Topic: 1512 Message: 1512

I have a KPC-3 that is a little over a year old that I'm having problems with. I was using it on APRS with no problem until a few weeks ago. All of sudden, stations would not show up on the map in WinAPRS. I knew it was transmitting because the transmit light would come on and my station would show up on FindU.com.

I did a bunch of troubleshooting and determined that the problem is the TNC is resetting itself every time it transmits. The TNC will send all the commands and then reset so it won't receive any stations.

I've unplugged the TNC, taken out the battery and tried to do a hard reset with the jumper. It worked once and then started doing the same thing.

Any ideas???

If you are having problems with the stock antenna and need to use a HT antenna vice a fully mounted 'big' antenna, I suggest using a HT antenna that has a little gain. The stock Kenwood antenna is not much more than a elongated dummy load. I can see the local voice repeater location from my front yard and Kenwood antenna is noisy where my Diamond 5/8 wave dual band HT antenna has full signal. Same results with the only APRS digi in our area. It is 18 miles away and I can hit it with the Diamond antenna if I drive up on the hill by the house. I can't even hit it with the stock antenna at the same location.

As I reported earlier, that has been my experience too. What really amazed me, in comparing various HT antennas on the D7, was that the rubber ducky from the TH-F6A actually outperformed the D7 ducky, when the F6 antenna is shorter and designed for broadband use. I wish I had an antenna analyzer that covers 450 so I could see where that thing actually resonates.

1519. Excellent Primer on NMEA Data Types

Yahoo group: APRS (1998 — 2006)
Date: 2004-03-25 16:39:12 UTC
From: Gene
Topic: 1519 Message: 1519

For those of you who are curious about what actually is inside that mysterious NMEA data output from your GPS that seems to confuse most people, take a look at this website. It may seem like a lot of scientific mumbo-jumbo at first but after you have read it, read it again. There is alot of information there that may help you understand what is happening between the GPS and the Radio, and ultimately help you get everything going 100%.

Besides you might actually learn something, which makes it a good day.

Cut & paste this link -> http://www.gpsinformation.org/dale/nmea.htm

I am currently using the Maldol on the D7. I haven't tried it on 450 as there is not much activity locally on that band. The improvement on 2-meters is that I can now easily get into the local digipeater, whereas before I could not at all.

Subject: [emergcomm] Info from Amateur Radio Newsline Report 1389 ? March 26, 2004
Date: Fri, 26 Mar 2004 08:50:13 -0500 (EST)

RESCUE RADIO: REACT AND THE AMBER ALERT PROGRAM

HAM radio appears to be leaving itself behind in the area of responding to notices of kidnapped children called Amber Alerts. Meantime REACT and other citizens radio organizations are taking the point position in spreading word of these vital searches.

NOBODY seems to know why hams appear to have no interest in the Amber Alert program, but other civic minded radio services are not standing still. And the April issue of Popular Communications magazine is highliting REACT as being one of those jumping in to providing communications for these alerts and searches.

THE magazine's Info Central column highlights the activities of REACT teams across Ontario Canada and the northern United States. This, as they responded to an Amber Alert issued by the Ontario police after Cecelia Zhang was abducted in Toronto.

RON McCracken who is past President of REACT told Pop Comm that they were given details of the alert and were asked to broadcast it on C-B channel 19 to truckers passing along the highways. The alert included details of the kidnap vehicle and the victim along with the suspects.

THE broadcasts began at about 5:30 in the evening and went on through midnight. McCracken says that CB radio was combined with computers and e-mail to spread the word far and wide in a very short time. This allowed truck drivers all along the border to keep an eye out for both the little Cecilia and her abductor.

ACCORDING to McCracken, this was REACT's first response to an Amber Alert and in his estimation it went very well. You can read the full story starting on page 5 of the April issue of Popular

Communications magazine.

THE Amber Alert was created in 1997 as a tribute to 9-year-old Amber Hagerman. She was kidnapped and brutally murdered while riding her bicycle in her hometown of Arlington, Texas.

IF you want to know more about how you can start an Amber Alert Plan in your area and involve your radio hobby, it can be found by taking your web browser to www.missingkids.com. Then click on the words Amber Plan.

1525. And now for something completely different

Yahoo group: APRS (1998 — 2006)

From: djs13
Topic: 1525 Message: 1525

APRS Tactical Identification (cc:RACES, EmergComm group)

As we know you must ID every 10 minutes and at the end of each communication according to Part 97. In digital operation you must ID using that protocol using the same time perameters. Can you also do the same with tactical messages.

Here is the premiss?

You are using APRS to track deployed assets on a large scale disaster. Let's say the size of a geopgraphically sizable county. In order to facilitate understanding on the part of all parties (hams and non-hams) could you use a tactical call sign in lieu of your amateur call sign in the MYCALL field? Then in the STATUS field insert your call sign. For Example: Smith County EOC would beacon SCEOC with its EOC icon and that would be displayed, yet, the status message which is also sent at the same time would have the call sign KO1D-2 as the status.

Why?

Well if I am the EMD for the event I want to look at that map and have things just jump out at me. I want to know where BUS4 is amongst the 50 icons on the screen. I know BUS4 is a mass casualty evac vehicle so knowing it is a short drive from Smithville Hospital is important. Yet seeing a Bus Icon with WZ8ZZZ-14 means absolutely nothing. Now I have to go to the Ham who is busy communicating, stop him from doing his communications, and ask where BUS4 might be at this time. He would have to look at his list of operators and see who is assigned there and then survey the map for that beacon. This all takes too much time.

I wonder what the jury thinks of this as far as Part 97 might say?

Dan S.

Topic: 1526 Message: 1526

Greetings to all ....

A little background before I pose all my questions.
My call is K6KAW and my QTH is Concord, Ca. in grid CM87xx.

I have been a ham for 10 yrs. Most of my time has been spent trying to find a mode that works for my living conditions. I spent quite a bit of time running APRS back when it was just getting going here in Ca. Thanx to Barry KC6WYA I learned allot and even setup demos at the Pacific Division Convention. However due to Allot of politics regarding who was going to control the network, I left.

Well I'm back and I got my D700a the other day.

I got it all setup fairly fast and was using it to get into the local repeaters. I find myself
abit confused about the APRS side of the operations. here are all my questions bare with me.

1> I understand that the rig uses Mic-E protocols. Where can I get info about it?

2>I got the GPS setup. Boy was that a chore. I'm using a Garmin Etrex. Has anyone had problems with it or the rig dropping one of the Long. digits. ei/ 122 will end up as 22?

3>I setup the home station and then go out driving around and I don't see a track. I look at the history list at home and I don't see a position icon or coordinates listed. Did I setup
something wrong? I should see coord. in my packets right?

Well, that's about it.

I look forward to lot's of help...

thanx

That might violate the "no broadcasting" rule for amateur frequencies, but even if it were allowed, I'm not sure how it would fit with APRS. In APRS (at it's simplest), a position is transmitted. So with an amber alert announcement, what position would be transmitted?

From: Randy Allen
Topic: 1524 Message: 1528

You put it out as a bulletin, that is, a message addressed to BLNA or BLN1 not to any specific station. No position is required for that kind of transmission. All stations with a receive capability in the local RF area will receive the message. AFAIK, all APRS clients support this format, and they should alert the operator (special sound, pop up box, etc) that a new bulletin has been received..

If you did feel necessary to put out a location, you can transmit it as an object.

FYI: There's already been at least one instance of putting out an Amber Alert on APRS here in the Dayton Ohio area. Fortunately a happy ending, child recovered safely (not through APRS or amateur radio).

It might be easier to find an APRS program that allows you to customize what info is displayed with each tracked transmitter. So that it shows the Info line rather than or in additon to the call of the transmitter.

1530. Re: [APRS] Another Public Service use for APRS?

Re-transmitting NWS Alerts is not a violation of the rules. There is no posit associated with those alerts other than from the station putting them in the net.
Amber Alerts are being broadcast by the NWS as an alert which will come across just like a severe weather alert.
There is no problem with the re-transmission of the Amber Alert.

Sounds like a good idea. I've always been a supporter of the use of
plain lauguage and tactical call signs. I hope this catches on.

<2>I got the GPS setup. Boy was that a chore. I'm using a Garmin Etrex. Has anyone had problems with it or the rig dropping one of the Long. digits. ei/ 122
will end up as 22?

Kenneth:
That's apparently a limit of the APRS specifications now. The system only deals with eight byes on position information, in the format DDD.MM.mmC with three digits reserved for Degrees, four for Minutes and decimal minutes, and the last byte used for the Compass direction, N/S/E/W.

That means APRS, under the current specifications, only has a limited position accuracy of some 60' (near the equator) to 30' (high lattitudes) and can do no better.

A decade ago that was probably sufficient considering the accuracy of LORAN and GPS. I would suggest that the APRS spec needs ot be overhauled to consider the new ISO standard formats for position and the accuracy from WAAS-GPS, which will require another digit--the one you've seen truncated. Or, a switch to that horrible new ISO standard of DD.ddddd which uses decimal degrees. (Which may work for engineers, but for marine navigation, all the nasty old divide-by-sixty stuff actually DOES make sense in terms of degrees and radians on a spherical surface. UGH.)

Of course even with the current APRS standards DDD.MMmm can create problems because you rarely can be certain that accuracy will carry through to a map and repeat to another person, but that's a whole other kettle of week-old fish.<G>

Jared, You really should refrain from answering any questions on this list. You obviously don't have a clue. There is no conceivable way the APRS spec could result in changing 122 degrees longitude to 22 degrees. Hmm...let's see....how many thousand's of miles apart are those two positions?

Kenneth: The Etrex works just fine with APRS. Double check your cable for any loose connections, broken or crossed wires, etc. Make sure your serial port comm setup matches what the GPS is using. 4800 baud is fast enough for this application and can result in fewer errors than a faster speed. It's also what the older Garmins default to, don't know about the Etrx.

I know this may be the wrong group; but does anybody know....
Can I maybe just connect the serial cable that came with my Etrex Vista to the serial programming cable for the TH-D7 using a null modem or other adapter??? Will this give me the data I need; or will I have to make a special cable for this.

Thanks in advance.
Shawn Pope

While you need to ID, you don't need to ID in exactly the same way as you transmit your tactical calls. You could insert your call in a beacon transmitted every 9 minutes. You could even attach a Morse keyer and ID in code, with the rest of the APRS never even seeing the ID, and you'd be perfectly legal.

At 10:58 AM 03/26/2004, you wrote:

Does anyone know of a good beginner/entry level/starter web site on APRS? I know of WB4APR's site which explains what it is, and a few like that. I am leaning more towards the how to use it side. I know things are probably quite software specific but certain basics, such as dealing with digi's and connecting 1 on 1 must be pertty similar (other than keystrokes).

Any ideas for a beginning?

I am running a TM D700a into a mobile antenna. When I am stationary I run my laptop into the rig with UI View software. I am a member of that list and have been reading up on the Help File. Looking to augment my studies a bit.

Thanks
Dan S.

<Jared, You really should refrain from answering any questions on this list. You obviously don't have a clue.>

Obviously, Ron, the only obvious thing is that I misread his post. I'm talking about truncating the least significant digit and with 20-20 hindsight, obviously he's talking about losing the MOST significant digit.

But thanks for taking the time, your failure to point out that error still pointed it out to me.

ORB-8 Balloon Flight

Oklahoma Research Balloons will, weather permitting, fly an unmanned high altitude balloon (ORB-8) to 70,000-80,000 feet on Saturday April 3, 2004 from Tulsa, Oklahoma. Time of launch is 0800 CST (1400z) and will carry an APRS digi. The freq. will be 144.340 and the call is KC5TRB-11. Predictions as of Wed. AM Mar. 31st show an hour and a half flight to the east, 30 miles.

Updates can be found at the following web sites...

http://www.gbronline.com/harrymue/orb
http://www.neoksimplex.com/cgi-bin/yabb/YaBB.pl?board=ORB

1553. Update on running UI-View32 under Virtual PC on a Macintosh

Yahoo group: APRS (1998 — 2006)
Date: 2004-03-31 21:17:47 UTC
From: Ron Cluster
Topic: 1553 Message: 1553

After an admittedly brief period of testing this, here is my report to the group.

UI-View32 v1.99 installed perfectly under Win2k Pro (New install, no service packs), running under VirtualPC 6.1.1 on a Macintosh G3 500MHz Powerbook running OS 10.3.3.

Installed Precision Mapping v5 from CD. Again, no problems. Installed and ran normally.

Both Precision Mapping 5 Traveler and the PmapServer went through their respective registration processes normally.

The program runs just as good as it does on my Intel hardware. Zoom around in the map, send and receive messages and position reports, everything. Slightly slower than my desktop PC (800MHz P3, Win2k Pro) but a lot faster than my old CTX laptop (133MHz P1, Win98SE). You can run it in a window or full screen.

I was able to log on to the APRS internet servers and send and receive data via TCP/IP as expected.

I used a Keyspan USB-Serial adapter (USB to a standard DB9, not the Mac Mini-DIN style). Installed it in Mac OS 10.3.3 using the Mac driver and then set Virtual PC to just use the Mac's "Comm Port 1" (which was really the adapter on USB).

UI-View32 was able to use a KPC3+ v8.3 in KISS mode, as well as Host mode NONE with the Kantronics init file. UI-View sent the startup commands to the TNC when UI-View was started and was able to get the GPS data from the TNC using the "KPC-3 Plus" method in GPS shared port setup. Sent the shutdown commands to the TNC when UI-View was closed. I used it mobile in the van and all the maps, tracking, GPS crosshairs, messaging, NWS shapes, UI-Route worked as expected.

So.....it does work. It does add a level of complexity to running the program but I didn't have any issues with either the install or operation. You would definitely want a newer, faster Macintosh. I was on a 500MHz G3 with 384MB RAM and the speed of the program was OK. I doubt you would want to try it on much less than that.

IMPORTANT: You should be familiar with the Macintosh operating system and with VirtualPC before attempting this. I ran into no issues with the above hardware and software but that doesn't mean that you won't.

That's how you identify your individual station. Hence from my home I am W6CCD (no suffix.) With my IC-706, I am W6CCD-6. With my TH-D7A, I am W6CCD-7. And so on. The "dash" number is called the Secondary Station Identifier, or SSID for short. It can be any number from 0 through 15.

Often, they don't mean anything. Somebody with multiple APRS units could put different numbers on their units so they can tell them apart, or have more than one unit active without conflict. Some people put -7 on if they are using a Kenwood APRS radio, since the Kenwood APRS model numbers start with the digit "7". And, the original APRS design specs had a suggestion that some numbers would display different icons, but most client programs don't use those numbers.

APRS SSID Defaults 20 Feb
2004----------
-- Since there are 20,000 APRS users on the air, the APRS maps and data canget very cluttered. Also, most operators have multiple stations on theair, such as their HOME, CAR, BOAT, and HT. It is very convenient to beable to recognize these typical applications at a glance. Here are thosecommon defaults: -6 is for Operations via Satellite -7 is for TH-D7 walkie talkies -8 is for boats -9 is for Mobiles -11 is for Balloons -14 is for Truckers Originally, in 1992, the first APRS GPS mobiles just transmitted rawNMEA-0183 GPS stings and so there was no way to insert a SYMBOL byte in the pre-formatted NMEA 183 packet. Hence we defined 14 common SYMBOLs asdefaults to the 14 available SSID's that a mobile could use. These included BIKES, HELOCOPTERS, AIRCRAFT, VANS and many others in additionto the ones above. In the late 1990's we came up with a better solution and defined theAX.25 TOCALL of GPSxyz for such use. In this case, the "xyz" characterscan be used to define any of the hundreds of APRS symbols includingOverlays. Just look up the xyz in the SYMBOLS.TXT file included in all copies of APRSdos (or these days, on the WEB). Since this GPSxyz concept was so powerful, it completely replaced theoriginal SSID assignments and so it was removed from the Documentation. However the convention for the 6 most useful ones remains and should beused in the absesnce of any other overriding conditions. One reasonfor using the -6 for Space applications is so that the global APRSWEB data bases will keep statistics and data for when you are operatingthroug the satellites separate from when you are working normally. So stick to the standards above for the obvious applications...

Ui-View32 is fast becoming the aprs choice for software. I have been using it for about 6 months now. It is very easy to set up and has lots of neat features. There is a ui-view32 user group here at yahoo. I'm still learning the features the software provides. I read all messages from the group. I give it 2 thumbs up!!! Give it a try, you'll agree. It cost about $10 to register it, but there is free version minus ceratain features. I don't have the website readily available but do a search. It can be downloaded from the site.

1565. GPS or radio?

Yahoo group: APRS (1998 — 2006)
Date: 2004-04-01 21:49:38 UTC
From: Mike
Topic: 1565 Message: 1565

I have a problem with the gps loosing satelite signal with the radio on. Turn the radio off, signal goes back up. Even when I disconnect the radio from the tracker/gps/antenna, signal level on gps still goes to zero with the radio on. I have used this gps with a laptop & street Atlas in a vehicle with no radio, works just fine. Therefore I believe the radio may be emitting signals that are interfering with the gps reception.Has anyone experience this problem, and if so, what do you recommend. Thanks in advance.

Topic: 1567 Message: 1567

Hi,

I have an event coming up where the APRS network is setup as a fully time-slotted system. Their command script specifies a packet transmission every 3:00 (180 seconds) from a fixed time using the BLT command.

I just purchased a Kenwood TM-D700A after noting several good reviews on its APRS capability. Alas, the BLT command is not on the docket, nor even exists on the Alinco 135TP radio set.

So what gives? Do I have to run with an outboard TNC? or can I make this work?

Any ideas?

Why can't you just set the D700 to tx every 3 minutes and let it go?

Essentially yes, and I see we should be able to do that with
LOCATION or a specific TX_INTERVAL.

But its slightly more.. we need to fit into a pre-assigned
scheduled slot within the 3:00 minute cycle. I am thinking we can
emulate a "start" by getting the system time, calculating the next
slot by computer, then sending the command at the right moment.

The other question - would an active system which got busy at the
moment of TX cause the TX to defer, or cancel and wait for the next
cycle. We would need that. A defer would trample someone else.

Thanks,, getting a confirmation on some of this is good.

In most cases it would cause a defer. I see what you are trying to do, and I am interested in seeing how it all works out. In a real world scenario, this would only work if you were using atomic clocks, so that all units would be on the same "time", and had some higher level of control, not just BLT. In the real world we are using TDMA but we aren't assigning out the slices of pie that we can transmit in and it all seems to work okay. Yes, some packets are killed in the process. I hope you are using a frequency other than the standard APRS frequency or else you will have other's packets coming in on "someone else's time".

Mike-
Certainly sounds like RFI from the radio is killing the GPS.
Solutions are to run lower power at the radio, or to separate/shield the radio antenna and the GPS antenna further. If your GPS can use an external antenna, that may give you enough distance or a chance to isolate it.

I'm told that the Europeans use a completely different packet protocol whereby stations are polled. The advantage is that the weakest signal gets equal time with the loudest. Anyone up to speed on this? Can we implement it? Would sure solve a lot of problems.

1573. Polling APRS (WAS: Re: Emulating BLT with a Kenwood D700A)

Yahoo group: APRS (1998 — 2006)
Date: 2004-04-03 03:34:46 UTC
From: Christensen, Eric
Topic: 1573 Message: 1573

I don't think polling is in use as it would take away from the "real-time"ness of the system. Also, the system would have to know what stations to poll to make this possible which means a station would have to transmit at least once out of turn. I'm not saying it is impossible, but it is extremely difficult to work all aspects of this plan for it to actually function properly.

Plus with a polling system, you would have a defined number of stations and an infinite planning scheme to keep neighboring networks from interfering. This is an interesting thought, though.

With the current APRS system using random TDMA (if you will), there will be collisions, as with any other data system out there, but they are generally kept to a minimum when people use proper paths and power settings. The addition of APRS WANs could improve our network even more by routing to specific digipeaters on a higher speed channel.

Thanks for the reply. You are right I'll probably have to purchase a gps with an external antenna. I pretty much narrowed it to that. The gps 12 has no means for an external antenna, however to confirm for the group. When I move the gps to the outside of the vehicle, the problem goes away. I can get a total of about 6 ft from the radio. It works fine at that distance. Gonna have to re-think my mobile aprs set up.

Depends on what you want to do. You don't need a radio or GPS unit to get going, you can download software like UI-View and be on APRS via the Internet. If you want to do APRS from your car you need a radio, TNC type device, and a GPS unit.

You need a radio of SOME kind to transmit the APRS position to a APRS equipped computer. You also need a radio of some kind at the computer to RECEIVE the packets. Most APRS is done on 144.39, a ham frequency. There are a few exceptions to this frequency, but they are still HAM frequencies.

If you are going to be USING HAM frequencies for APRS then you doggone well better BE a ham to be transmitting there!!!! Which means getting at least the no-code tech license to be using that frequency. Its really a fairly easy thing to do!! Its tons of fun, and well worth doing.

Just for the record: APRS is more than just positions. It's for any short
tactical message that would be useful when transmitted in a directed OR
non-directed manner in a local RF environment.

>You also need a radio of some kind at the computer to
>RECEIVE the packets. Most APRS is done on 144.39, a ham frequency. There
>are a few exceptions to this frequency, but they are still HAM frequencies.

There's nothing restricting APRS to just ham frequencies. If the MURS
service allows data, you could use MURS radios. If you had access to some
other radio service that allowed data, you could use APRS there as well.

>If you are going to be USING HAM frequencies for APRS then you doggone well

Glen,
That is probably one of the best things about APRS... You don't need a listing of the APRS digipeaters! Just setup all your equipment, tune your radio over on 144.390 and sit back and watch your screen. You will see stations start popping up! For transmitting, just set your path to something like WIDE2-2 and see if you can hit the local digipeater. If you can't then add a "RELAY" in front of that and see if you can hit a RELAY digipeater that can relay your packet to a WIDE digipeater in the area.

Have fun!

One of the few other things to keep in mind might be the remoteness of your camping site-- the chance that no one in the area is using APRS on 2m. If you're not certain about the area, a 30m rig might be worth considering. If your Scouting demos are part of a JOTA (jamboree on the air) style setup, a rig capable of 30m FSK/AFSK will probably already be available.

Glen, I haven't heard of such a list but http://www.tapr.org might know if there is one. In theory the APRS servers could be polled and a list of stations submitting positions (Igates) could be generated, sure. In practice...I don't think it is that formal, since anyone can open or close a station at any time.

Camping usually means "boonies" to me, you might want to check online to see if you get any position reports from that area before you drag along the laptop. If there's a digi in the area, it should show up on the internet feed and the maps. If there's an empty area--and there are huge ones--then no joy.

Still, you could set up your laptop to received and plot, then send some of the kids off with a transmitter and have the others track them. Self-contained demonstration of APRS as a tactical tool. And they might get a kick out of seeing the internet feeds if you open up the range filters. Seeing the International Space Station and assorted satellites flying by puts things in a very different perspective.<G>

Hi all,

Just going around to make sure i'm on all the APRS listservs, and
sure enough, I wasn't on this one.

Hopefully i'll be able to help someone at some point <grin>.

At any rate, just thought i'd drop in.

1593. Non-ham call signs?

Yahoo group: APRS (1998 — 2006)
Date: 2004-04-15 19:32:20 UTC
From: KC2MMi
Topic: 1593 Message: 1593

If I see an APRS station with a call sign in the format "xx#xxx" i.e. two letters, one number, three more letters, and it is obviously not a ham call sign, how can I find out who/what that station is?

Would a Sx#xxx series identifier be a Skywarn-issued call sign? Is there any registry or lookup of these? And, are they only supposed to be used on fixed weather stations? or what?

Occasionally a bad packet will be put out and then remain for 10 days on findu. I have had it happen to my station N4BK-7 one time. This is what might have happened, A perfect example is KD4BJQ sent a bad packet and it is showing as JD4BJQ.

Where it is not possible to include a symbol in the Information field or in the Destination Address, the symbol may be specified in the SSID of the Source Address instead:

SSID-Specified Icons in the AX.25 Source Address Field

SSID Icon
-0 [no icon]
-1 Ambulance
-2 Bus
-3 Fire Truck
-4 Bicycle
-5 Yacht
-6 Helicopter
-7 Small Aircraft
-8 Ship (power boat)
-9 Car
-10 Motorcycle
-11 Balloon
-12 Jeep
-13 Recreational Vehicle
-14 Truck
-15 Van

Or it could be the xth station he/she has on APRS. A lot of times the number doesn't mean anything except to differentiate between stations.

Can someone point me to a "dummies guide" for understanding what all the wide,2-2, relay type settings mean ? I'm struggling trying to understand this.

Andy K3UK

1599. RE: [APRS] wide,wide relay, wide,5-2 ?????????????

Yahoo group: APRS (1998 — 2006)
Date: 2004-04-22 12:28:56 UTC
From: Eric H. Christensen
Topic: 1598 Message: 1599

I'm not sure that there is a "APRS for Dummies" guide yet BUT I can point you to one resource and I can try to explain what is going on in the network when you send out a packet...

My resources is the APRS SPEC. That document allows a historical and current view of APRS. It explains EVERYTHING.

Now on to the networking part.

The network is based on "WIDE" digipeaters. These WIDE digipeaters typically can hear at least two other WIDEs and cover a "wide" area. So, your whole goal in the RF community is to hit a WIDE digipeater which will allow other stations to hear you and allow communication. Now if you can hit a WIDE digipeater directly without using a relay then you are golden! Set your path to something like WIDE2-2 or WIDE3-3 (depending on what is suggested in your area) and have a ball. But if you cannot hit a WIDE directly because of geography or maybe you are running an HT that has limited range, well you are probably thinking "Gee, I could really use some help around here... I wish someone would relay my packets to that WIDE down the street". Well, in theory, every station that can hit a WIDE digipeater directly should be setup as a RELAY digipeater as well. (Of course there are going to be exceptions... There is no need to have fifty stations acting as RELAYs all within a square mile.) So you set your path as RELAY,WIDE2-2. This is now addressing your packet to a larger audience for digipeating. You may well get digipeated multiple times on the first "hop" of your path. Now I can see the wheels a turning... You say, well if I can reach that many more people running RELAY then why not use RELAY,RELAY,RELAY as my path? The answer is very simple... Your goal is to reach a WIDE digipeater not all the RELAYs. If you hit a WIDE then all the RELAY stations are going to hear you anyway, they just won't rebroadcast you because, frankly, that would be a death shot. Imagine you hit a WIDE on your first hop (most WIDEs are also set to respond to RELAY) and the second hop is a RELAY, well you will have 20, 50, or more stations keying up and rebroadcasting your packet creating the biggest pile of QRM you have ever heard! Plus, and I have heard it happen with my own two ears, with all the rebroadcasting would you believe that nine times out of ten the receiving stations never got a change to decode that packet because of all the "noise"? So that is a no-no.

I guess I should also touch on the n-N protocol. In the past, we used to use WIDE,WIDE,WIDE. That took up a lot of time on the radio (relatively speaking). I don't want to break it down for you or anything but lets just say that there is more data in there than in WIDE3-3. Less data, less radio time. Less radio time, more time for everyone else. So the birth of the n-N protocol. Look at it as WIDEn-N. The "n" signifies the number of hops originally, in our case 3. The "N" specifies the number of hops left, in

our case 3. So you have your path set to WIDE3-3 and it goes out and it is heard by our first WIDE. That WIDE takes that packet and rebroadcasts it, but it changes the path to WIDE3-2. You see the 2 specifies the number of hops left. The next WIDE hears it and does the same thing and now you are at WIDE3-1. The third WIDE hears it and now you are down to WIDE3 which gets no response from any digipeater because it doesn't know what to do with that. Now with your WIDE3-3 packet you have probably cleared some serious ground. Around here two hops will get you out of the state in ALL directions. That's right ALL directions. You can't think linearly with APRS because unless the path doesn't exist in another direction, your packet will propagate down the network in ALL directions. So remember that. Also, remember that APRS is a Regional and Local packet network. It is not designed to be used nationally. What does that mean? Well, I shouldn't expect for my packet to leave the East Coast and be seen anywhere near the Mid-West and I shouldn't create a path to do that, either. Why? Well, if everyone did that, then there wouldn't be enough air time for everyone to get on their local networks. You say "Well, my network doesn't sound busy" and it may not, but you can't hear how busy that other network is. Take your station with a long path and multiply that by ten stations (not a lot and is usually a much higher number) and you have significantly increased the load on the network in all directions!

If I missed anything, please let me know. As it is 8:30A and I am sick I may have forgotten to explain something or I might have still left it a bit complex at a point so let me know.

Have a great day!

73s,
Eric KF4OTN

-Thanks very much for taking the time to write this explanation, I will read it a few times today. One quick question. You mentioned "depending on what is suggested in your area". In my area there are no suggestions. There are just 4-5 APRS stations locally, two fixed stations , mine and a friends 6 miles away. There is a NODE about 20 miles away also. My friend and I are trying to set up our stations to digi the mobile stations that pass though our area. The node about 20 miles away is difficult to hit from my location and mobile trackers seems to have a hard time getting picked up by it even when closer too it.

The direct RF stations I hear are mostly a long distance, example

```
2004-April-22 09:06 4 Stations Heard Direct
-------------------------------------------
Callsign Type Latitude Longitude Miles Bearing Last
Heard
-------- ---- -------- --------- ----- ------- ------
----
-K3UK Girl Scout 42.23.79N 079.21.52W 0.0 0 Apr 22
09:03
-WB7SWW WX Station 42.28.95N 079.20.57W 6.0 8 Apr 22
08:43
W2ICZ-2 (N) Digi 43.00.18N 078.47.05W 51.1 35 Apr 22
08:48
VE3VWD (N) Digi 43.42.43N 079.23.94W 90.5 359 Apr 22
09:06
```

Key: '+' = UI-View user '*' = heard via a digipeater

The status message for the digi W2ICZ is ...

08:48:46R W2ICZ-2>APRS,WIDE

Do you have any suggestions for what setttings we should have to help the mobile stations get relayed. We are a rural hilly area.

Thanks again,

Andy K3UK

1601. RE: [APRS] Re: wide,wide relay, wide,5-2 ?????????????

Yahoo group: APRS (1998 — 2006)
Date: 2004-04-22 13:23:28 UTC
From: Eric H. Christensen
Topic: 1598 Message: 1601

It sounds like you need to setup one of your stations as a RELAY digipeater. My question to you is "Can you hear the WIDE that is 20 miles down the road?" If not, then you may need to setup one of your stations as a WIDE (with RELAY support). As far as the path, I really can't speak for your area without a LOT of data that would tell me the load in your network and the adjacent networks. So let your software stay up for a day or so and watch to see how many stations you can see out there and how far you want to be heard. If you are only interested in being seen in your local area, then just run WIDE. Know folks further out than that and want to be seen by them, increase the path. I just brought up my software and I'll see if I can see your network (from the APRS-IS) and see if I can "see" your network.

Topic: 1598 Message: 1602

Okay... I found you. I really like the way the network is setup around there... Very logical. Two hops should have you seen in at least six metro areas within the US. I also see that WB7SWW is acting as an I-Gate for your area so you are making it to the APRS-IS without any hops! Two hops seems to be a good place to start...

Subject: [APRS] Re: wide,wide relay, wide,5-2 ?????????????

-Thanks very much for taking the time to write this explanation, I will read it a few times today. One quick question. You mentioned "depending on what is suggested in your area". In my area there are no suggestions. There are just 4-5 APRS stations locally, two fixed stations , mine and a friends 6 miles away. There is a NODE about 20 miles away also. My friend and I are trying to set up our stations to digi the mobile stations that pass though our area. The node about 20 miles away is difficult to hit from my location and mobile trackers seems to have a hard time getting picked up by it even when closer too it.

The direct RF stations I hear are mostly a long distance, example

```
2004-April-22 09:06 4 Stations Heard Direct
-------------------------------------------
Callsign Type Latitude Longitude Miles Bearing Last
Heard
-------- ---- -------- --------- ----- ------- ------
----
-K3UK Girl Scout 42.23.79N 079.21.52W 0.0 0 Apr 22
09:03
-WB7SWW WX Station 42.28.95N 079.20.57W 6.0 8 Apr 22
08:43
W2ICZ-2 (N) Digi 43.00.18N 078.47.05W 51.1 35 Apr 22
08:48
VE3VWD (N) Digi 43.42.43N 079.23.94W 90.5 359 Apr 22
09:06
```

Key: '+' = UI-View user '*' = heard via a digipeater

The status message for the digi W2ICZ is ...

08:48:46R W2ICZ-2>APRS,WIDE

Do you have any suggestions for what setttings we should have to
help the mobile stations get relayed. We are a rural hilly area.

Thanks again,

Andy K3UK

Eric, the most "real people" explanation I've ever seen. Congratulations.

Andy, I run a local APRS digi in town, and I'm surrounded by 4 excellent Wides - one in each quadrant. Clearly no need for mine to be a Wide too. The digi uses the Digi_NED programme (three of the Wides - also limited to 3 hops - are using it too resulting in vastly reduced numbers of duplicate transmissions) and it is set up using the Relay routine. The bennie is that while mine rarely transmits - ID and the occasional relay - it contains a host of ARES response information, and tourist data, that can be brought up if required (i.e. "?EOC"). That of course can feed the 'on-board' GPS in the responding vehicle solving some of the navigation problems.

Anyway, I'm well within three hops of you (100 nm due north of you at Barrie, ON) and regularly see stations to the east and west of you so there has to be "system" problem as well as getting the Relays set up correctly.

Subject: RE: [APRS] Re: wide,wide relay, wide,5-2 ????????????

It sounds like you need to setup one of your stations as a RELAY digipeater.
My question to you is "Can you hear the WIDE that is 20 miles down the road?" If not, then you may need to setup one of your stations as a WIDE (with RELAY support). As far as the path, I really can't speak for your area without a LOT of data that would tell me the load in your network and the adjacent networks. So let your software stay up for a day or so and watch to see how many stations you can see out there and how far you want to
be heard. If you are only interested in being seen in your local area, then
just run WIDE. Know folks further out than that and want to be seen by them, increase the path. I just brought up my software and I'll see if I can see your network (from the APRS-IS) and see if I can "see" your network.

Yeah, it sounds like there might be a ridge or something else that is
between him and that WIDE. If he can get a station up high enough in his
area that can hit that WIDE he could setup his own digipeater in his town.

You are the correct , there IS a ridge between me and the wide node that is 20 miles away. Hiowever WHY would mobile stations that drive within a few short miles of the wide node (N3HPR-11) , within light of sight, not get picked up by it ?

Here is my current direct list

```
2004-April-22 21:33 7 Stations Heard Direct
-------------------------------------------
Callsign Type Latitude Longitude Miles Bearing Last
Heard
-------- ---- -------- --------- ----- ------- ------
----
-K3UK Girl Scout 42.23.79N 079.21.52W 0.0 0 Apr 22
21:13
-WB7SWW WX Station 42.28.95N 079.20.57W 6.0 8 Apr 22
20:53
KC2LFV-4 Car 42.29.02N 079.19.66W 6.2 15 Apr 22
21:05
W2ICZ-2 (N) Digi 43.00.18N 078.47.05W 51.1 35 Apr 22
21:18
VE3GAN Home 43.07.73N 079.12.45W 51.1 9 Apr 22
21:29
VE3OAK (T) Digi 43.28.23N 079.41.63W 76.1 347 Apr 22
21:24
VE3VWD (N) Digi 43.42.43N 079.23.94W 90.5 359 Apr 22
21:30

Key: '+' = UI-View user '*' = heard via a digipeater
```

The wide nodes info is ... 21:26:44R N3HPR-11>BEACON,WIDE3-2 <UI Len=61>:
!4209.73NN07931.93W#PHG7530/A=001800/WIDEn-n Digi Sherman NY

The mobile stations current info is....
21:35:14R KC2LFV-4>APT310,APRS,N3HPR-11,WIDE3-3 <UI Len=48>:
/230135z4229.03N/07919.67W>055/000/A=000511/CAR4

Looks like he actually IS getting picked up by the wide node, for once !

I have mine at wide, wide just to see what would happened and WB7SWW who is set as an igate at the moment is displaying
20:53:36R WB7SWW>APU25N <UI C Len=64>:
@230054z4228.95N/07920.57W_072/000g012t048r000p012P000b10020h

From: mdrdg@ourtownusa.net
Topic: 1598 Message: 1606

One of the things one has to remember about APRS vs Packet is all transmissions are transmitted without expecting an acknowledgement back from anyone because it is sent in unproto "unprotected" and there will be no "re-try" so it is a "one-shot" transmission and when the station is moving many things come into play that may prevent a digi from hearing it that one time transmission such as doppler effect cross-polarization due to obstacles until the next beacon 3 minutes or so later.
This is not as apparent in fixed stations with relatively good antenna installations even if you percieve the mobile to be in close enough proximity to be heard it just might not be for 1,2 or more beacon elapses.
Bob

What APRS software works with what commercial Maping software. I want to be able to follow APRS trackers on maping software "Like" MS Streets and Roads, DeLorme Maps or Pecision Maps. I want to be able to see what street or road they are on. I will be using a Kenwood D-700, A Rigblaster and a Etrex GPS. I want to be able to keep track of vehicles on a map during a emergency.

An alternative to UI-View is WinAPRS+SA which intigrates
WinAPRS with StreetAtlas

http://www.tapr.org/~kh2z/aprsplus/

it only works with Street Atlas 4 though 9 though. You can still buy
copies of I think 7 though 9 from the folks at Delorme

From: Eric H. Christensen
Topic: 1613 Message: 1614

This is something I wrote up after Hurricane Isabel...

The Washington County EOC activated approx 48 hours prior to the storm making landfall. Our Emergency Response SOGs stated that once the winds hit 50 mph fire, EMS, and law enforcement would not be responding to calls. Because we only have access to a weather station at the extreme western side of the county, we used APRS to monitor a weather station just east of our county (KB4TOH-11... Thanks Mike and Dave). When it was determined that the winds were over the limit, we stopped all emergency responses until speeds subsided to a safe speed.

The FireNet data helped a lot as well. Besides providing more weather stations to confirm wind speed and direction, rainfall from these stations helped determine flooding. Curt was able to modify his program that parses the Rivergaging stations so that we would get updates every 5 minutes. This kept me inside the office instead of walking out to the Roanoke River to check the manual gauge we have... (Can someone please petition to put a shiny new river gauge back there so I don't have to go out there at all?!?)

I'm looking at putting together some small trackers that can be thrown in emergency vehicles that are going out during the storm so we can determine their location... exactly. At one point, we had three people trapped out in the storm that couldn't get back due to trees blocking the way and we couldn't determine exactly where they were to be able to get them out... They now vow to never go out in another storm... :)

We did send some test messages to the Dare Co EOC that were acked but never responded to... They were busy. But we did have comms with them and other users in the area so that was really good. Hope this makes APRS shine! It definitely worked for us!

73s,
Eric KF4OTN

One method I know of was used with Emergency Search and Rescue teams in our area. A group of trackers were made using hand-helds. These were placed with each team going out. one relay station was set up overlooking the search area and an indepentant network was designated for the search. A computer was setup at the base camp and they could see where all the search teams were. The APRS system allowed better control of the search teams to insure all the search area was covered.

It actually came in handy one team had an accident and the APRS system eased guiding a second team to assist.

David,
At the top of the APRS+SA screen there is a "commands" tab. Click on that and then chose "start street atlas". You may have to do a little more set up but that should get the stations on the map to start.

Greetings David,
Hopefully this will help out, it sounds as if everything is working with APRS+SA, if you are hearing "update" then you are tracking a moving object OK. Check the following:
Second menu bar from the top, click on the "Track" tab, on the right hand side of the page are some boxes, check both the "Enable Tracking" and "Auto Map Update" this will bring up the map of the station you are tracking.

Under the "Maps" tab in the left column when you click on "All Reports" or "Latest Reports" does it go to the "Map Window"? Do you see icons/callsigns on the map?

Check this also; Top menu bar at the top of the page, click on "Setup" then click on "Main" make sure that NO range filters are checked at the bottom right corner.
Good Luck.

When using APRS + SA you must start SA from within the APRS program. It is in one of the drop down menus. If you manually start SA from the SA disc the info does not get passed to the map. Hope this helps.

We use APRS for Skywarn up here, lets us track not only WX but location of the event as well. Races such as the MS 150 have had emergencies that have been handled by APRS traffic as well for information needed and NOT wanting it aired.

Fortunately, we've not needed emergency comms lately.

We have, however, exercised using APRS.

We use the Bulletin feature to put out "one to many" messages such as net activations, weather warnings, etc.

The local EMA director is very interested in using trackers on things such as buses used in evacuations, supply vehicles, etc.

I've used the keyboard-to keyboard messaging as a "meet me line" during an SET to coordinate another frequency for packet transfer with another APRS station. All we had to do was QSY to the agreed upon Freq., switch to packet software, pass the information, and then we went back into APRS mode for monitoring. I do NOT recommend extended message comms on the APRS freq (such as large lists or text files).

And of course we've used it for monitoring WX stations.

And don't dismiss the visual display of stations, even static ones for maintaining situational awareness. It can save a lot of time and radio traffic. And is a very easy way to answer "where is..." questions from non-hams such as event sponsors and Emergency personnel.

Topic: 1608 Message: 1625

Hi.

Here in good old Oz we have found that what we used to use has disapeared apparently because Microsoft has bought some company and now charges for something that was free before. Hey bussiness is bussiness.

Anyway I needed sought of something similar so I bought a disk that contained the maps that is used with Uiview (I think) and stared to write my own software for my own use. I have my own radio network for voice and data and I also use the APRS one as well.

What I have done is make my software log into an APRS server to get the data for those stations and also use a packet modem to watch my own network.

Basically it will be able to use images of maps (Scanned or whatever) as long as you know say a couple of co-ordinates.

I have made it so you can select a map and watch anyone that appears in that area, select a station and let it selecat a suitable map, select a station and it will show that one and any one else in the same map...

I also have alarms built in for stations that stop moving and other options.

I am quite happy to develop it for others and sell it for shareware. My software is never more expensive than $50.

If anyone is interested, drum up suport, suggestions etc I will write it for everyone. If no one else sees a need then it will continue to be used here. Pass this message along to other groups etc. The more support I get and away we go...

Regards, Peter

Try downloading the free version of UI-View ant www.ui-view.com ,
it does not have all the maps you will need but it will get uou
satarted and you should be able to find maps for your area.

To "get going" you can connect via the Intenet and see a APRS
stations in your area, and else where. If you don't want to use the
internet you will need a radio and a way to decode packets. On HF
APRS via packet in on 30 meters mostly, with some on 20M. ON VHF/2
Meters in the USA APRS is via 1200 baud packet on 144.930. To
decode the packet you will need eith a soundcard packet program like
AGWPE, check http://www.qsl.net/soundcardpacket/ This program
works well. To "listen" all you would need to do is install the
software and connect the output of you radio to the input of your
computer soundcard. To transmit you will need to build a VOX
circuit to "trip" the Push To Talk circuitry of yoy radio.

If you want to NOT use souncard packet you will need a TNC of some
sort.

1630. Using a desktop PC as a mobile !

Yahoo group: APRS (1998 — 2006)
Date: 2004-05-03 00:21:03 UTC
From: obrienaj
Topic: 1630 Message: 1630

I am toying with the idea of using an old deskptop PC (AMD 450) as an occasional mobile APRS station. Mostly because the old PC is just laying around unused AND it has two serial comm ports that would accomodate both my TNC and GPS device. I have a DC/AC inverter that I can use to power the PC while in the van.

My main worry is the impact of bumpy roads on the hard drive in the PC. Is it likely to cause the HD to crash fairly easily? Any thoughts on securing the desktop and monitor safely in the back of a van. Maybe the whole idea is too crazy!

I don't have TM-D700A but since the D700 already has a TNC I would think that you need the cable that connects to the computer's serial port and not the sound card. The PG-5A cable on this:

http://www.universal-radio.com/catalog/fm_txvrs/4116ops.html

page might be the one you need. Again, I'm not 100% positive on the cable. I do have the HT version of the D700 (the TH-D7A) and all I do to read APRS packets on my computer is connect a serial cable from the HT's PC port to the serial port on my computer.

Laptop drives are stressed for harder duty. An acquaintance
of mine built up a mobile MP3 player that feeds the aux audio
inputs of his auto sound system. He lost the first drive (a 5.25"
6gig) in two weeks. He switched to a 12gig laptop drive with
a cable adapter and has had no problems in 10 months. But
he still has a full image backup of the vehicle drive in case it
dies and he has to replace it. But he still shuts the MP3
player off before he goes off road.

I have had the board and some of the parts on order from Rxcomm for 4 weeks now. He keeps saying that it will ship very soon but never does. If he was honest I could live with a delay but so say the it will ship and then not does not set well.

<My main worry is the impact of bumpy roads on the hard drive in the PC. Is it likely to cause the HD to crash fairly easily? >

Andy-
Yes! Hard drives in home computers have no shock protection. To give you an idea, the newer hard drives in better laptops (IBM) are in gel mounts, not simply screwed down, to absorb vibration. And their newest ones have solid-state accelerometers on the drive which cause the heads to retract and park when a sudden motion is felt. Hopefully before the motion ends with the shock of hitting something.
You'll see drives are rated for the shock the can survive while in operation--and while parked. While in operation the rating is very low. Even with most laptops, they are meant to be cushioned on your lap not attached to a vehicle hard point. Your best bet is to have enough memory in the computer so it can run entirely from memory most of the time, leaving the drive safely parked and not in operation. (i.e. set the power down to park the drive when not in use for one minute, less if possible.)
Since it is an old computer....expect a drive failure may be total, don't keep anything critical on it. If you drive carefully, avoid RR tracks (!) and shock mount the computer it can often work for a long time. Cheap mean's shock mount: put it on a thick foam rubber pad or other "upholstered" seat with shock cords, don't bolt it to the floor.
May be simpler to buy an old cheap laptop and do the same thing, The power supply is built in, and there's much less mass, so shock mounting it is easier.

Good luck!

Andy,
I doubt the hard drive would be at any more risk than a laptop HD would be, but the laptop is usually sitting on a seat , giving it some shock absorption. I have done such thing in the past, but set the unit on medium density foam rubber. Such as egg crate foam used on beds, maybe a double layer.

[[[originally replied only to originator, but then realized that others might be looking at the same sort of project, so will repeat it here.]]]

You might do well to look around the web for various designs of shock mounts, and then engineer something similar for suspending the hard drive within the case. I've seen many types of equipment suspended by steel or nylon loops that are rigid enough to support the unit, but compliant enough to absorb some shocks.

Another thing you might think about: If the machine has enough memory to not need to refer to the hard drive constantly, set it up for a really strict power-down delay on the hard drive. Something like shutting it down after it's been idle for a couple of minutes. That way, it will spend more time powered down, a mode more resistant to shock damage than when it is spinning. Of course, this also means you'll have to wait for it to spin back up every time you want to access it again.

Might look into a notebook drive, as they have lower masses, quicker spin-up periods, and are generally designed to be used in a portable situation, with all the knocking around, spin-ups and spin-downs associated with notebook power saving features.

If you want to go really extreme, install a card reader (CF or PCMCIA) and a large flash drive card. Use the physical hard drive to store the system, drivers, and all the "boring" utility stuff, and use the solid-state (read: immune to physical shock) flash drive for your "running gear" programs. Again, set a really strict power-save timeout. Once the computer boots and the hard drive spins down, you should be able to take it down all the washboard roads you like without worries.

Just make sure you strap the 'puter into one of the passenger seats with a seatbelt. The seat will provide some isolation from the frame, and the seatbelt will prevent it from becoming a 30-pound metal missile in the event of a crash or sudden stop. We wouldn't want anyone getting killed.

1642. Radios with built in TNC's for APRS

Yahoo group: APRS (1998 — 2006)
Date: 2004-05-04 00:32:39 UTC
From: obrienaj
Topic: 1642 Message: 1642

I am aware of two radios that have internal TNC's with APRS capability...the Kenwood TM-700A and the Alinco 135TP. Are there others?

Of the two I mentioned (I do not know much about them) ...am I correct in thinking

1. Both can tranasmit FM voice on a 2M repeater while a "sub-band" allows sending of APRS beacons on 144.30 ?

2. Both have serial connectors for a GPS unit ?

3. Both have displays that show data from the GPS (position) ?

4. Both have displays that would show a received APRS message?

5. Both have commands within the TNC that would allow a response to a received message?

> allows sending of APRS beacons on 144.30 ?

Kenwood Yes, Alinco no. The Alinco is 2 meter only mono-bander. the Kenwood is a dual-VFO dual bander (2M and 440) that can do APRS and 2M (or 440) voice at the same time.

> 2. Both have serial connectors for a GPS unit ?
The Kenwood uses a stereo phono jack type connector for GPS data, the plug is included with the radio and you can wire your own adapter as needed. I think the Alinco has a similar set up. The serial connectors on the radios are for hooking up external computers for programming/ running APRS clients.

>
> 3. Both have displays that show data from the GPS (position) ?

Yes on Kenwood, No on Alinco. You need to hook a computer up to the serial port on the Alinco radio to display data. Other wise it's a dumb tracker.
>
> 4. Both have displays that would show a received APRS message?

Same as with #3 Above (Yes on Kenwood, No on Alinco.)
>
> 5. Both have commands within the TNC that would allow a response to

I used the Alinco with a StreetPilot 3 and found it worked great as
a simple way of getting my position out. The serial out of the SP3
went to the mini jack Data in on the Alinco. I also used it with the
recently discontinued Radio Shack Digitraveler.

Hi Andy,

I have a Kenwood TH D7A handheld that has a built in TNC. The gps connector is similer to a audio plug, but has 4 connections. With the HT, I can listen for Aprs on band b, and transmit fm on 2m or I can reverse it, and transmit fm on 440 on band b and listen to aprs on band a. I can send and receive APRS with no problems. The display does not use the full APRS character set (the icons for APRS stations), but that is no major problem. You can send and receive APRS messages with no problem.

Randy ka4nma

In a message dated 5/3/2004 5:33:34 PM Pacific Daylight Time, obrienaj@... writes:
I am aware of two radios that have internal TNC's with APRS capability...the Kenwood TM-700A and the Alinco 135TP. Are there others?

Of the two I mentioned (I do not know much about them) ...am I correct in thinking

1. Both can tranasmit FM voice on a 2M repeater while a "sub-band" allows sending of APRS beacons on 144.30 ?

2. Both have serial connectors for a GPS unit ?

3. Both have displays that show data from the GPS (position) ?

4. Both have displays that would show a received APRS message?

5. Both have commands within the TNC that would allow a response to a received message?

Andy-
Even on the Kenwoods, APRS is not sent on a sub-band of any kind. APRS is essentially just an AUDIO tone burst that is being sent out the same way as your regular audio carrier. The Kenwoods are usually smart enough to wait for no activity on the radio, and then send the burst. But as long as you are talking--it can't do that. It will wait for you to let go of the PTT, and then add the burst the same way that most repeaters have a "roger tone". Or use other options.
Kenwoods with a dual VFO can *receive* APRS data on one VFO while you are using voice on the other, but AFAIK, you've only got one transmitter in there <G> so only one can be sending audio out at any given time.

APRS works very muich the same away as an old computer modem, sending data in tone bursts over the radio instead of the phone line. Still needs that "phone line" to be uninterrupted, to give you clear data on the other end.

1651. RE: [APRS] Using a desktop PC as a mobile !

Yahoo group: APRS (1998 — 2006)
Date: 2004-05-04 20:19:18 UTC
From: Martin Maxwell
Topic: 1630 Message: 1651

I had a friend I used to work with that had a old suburban that used to be a news live truck. It had a generator and some other electronics stuff in it. Where a lot of the old live truck stuff used to be he mounted a desktop size computer system with several hard drives full of MP3's, an external monitor on the floor of the passenger side, and a keyboard up front. He had both the car sound system and a external stereo system in it.

While I worked with him at least I am not aware of him losing any hard drives, though I would agree that mobile use of standard PC hard drives might be asking for trouble.

Subject: [APRS] Using a desktop PC as a mobile !

I am toying with the idea of using an old deskptop PC (AMD 450) as an occasional mobile APRS station. Mostly because the old PC is just laying around unused AND it has two serial comm ports that would accomodate both my TNC and GPS device. I have a DC/AC inverter that I can use to power the PC while in the van.

My main worry is the impact of bumpy roads on the hard drive in the PC. Is it likely to cause the HD to crash fairly easily? Any thoughts on securing the desktop and monitor safely in the back of a van. Maybe the whole idea is too crazy!

From: w3ce_qrp
Topic: 1652 Message: 1652

Driving around the Lehigh Valley area of PA (Allentown, Bethlehem etc), I notice my tracker does not show up on findu.com. If I connect my base antenna to the mobile rig while in the driveway, it does show up. This is running 50 watts for all cases.
I remember the last time I tried APRS, about 2 years ago, my 5 watt HT was being tracked OK.
I am investigating setting up a relay at my home QTH overlooking the valley.
This is the third largest metropolitan area in PA, and a big dead spot for APRS.
I'll be at Dayton next week picking up some equip for this. I'll keep everyone informed of my progress.

From: KC2MMi
Topic: 1642 Message: 1653

<<Kenwood TH D7A... The gps connector is similer to a audio plug, but has 4 connections. >>
Not quite. It uses a standard 2.5mm 3-conductor "mini stereo headphone" plug. There is a 4-conductor version of a 2.5mm plug, which someone else (Yaseu?) is using for ear/mic connections now. Oddly enough it it often cheaper to buy a cheap headset and throw away the ear pieces, than to buy a 2.5mm stereo plug with wire. I'm glad we don't need to look for the 4-conductor plugs, those are NOT locally available.

<<or I can reverse it, >>
VFO-A and VFO-B each will cover 2m, and each cover one other separate. Just to clarify, the other bands are different and only VFO-B covers 440. You can receive APRS + 2m voice at the same time--you just can't transmit at the same time.

<< I can send and receive APRS >>
Not quite!<G> Sorry, but this can be a big issue. The D7 supports Mic-E, it does not support the full APRS specification. It cannot display compressed posits, which are the only way to get the same lat/lon accuracy that a GPS ordinarily displays. It truncates the DDD.MM.mmm position that a GPS usually displays down to DDD.MM.mm.

And it only displays 20 characters for a "STATUS" position, the APRS spec is longer.

The D7 supports a very limited subset of the APRS specification, for many users this will be enough since it is the ONLY support of APRS in an h/t. For others...it will not be enough. At that point it can be used as a radio with a built-in TNC and external solutions, but it may be more effective to simply use another ht solution for that.
I'm really surprised that Kenwood doesn't address this issue with a "MarkII" that supports the full APRS spec. And, a more legible display.

I am not sure about this combo but the Digitraveler wants to see voltage on pin3 of the serial out to turn on. There is a lot of documentation on this
on the web if you search on google. How that happens with the D700A I cannot say!

Barry, the Rino is a radio with mic/ear/ptt connections available on it. So yes, you could just plug in APRS equipment.

But the Rino is an FRS radio where there are specific rules from the FCC about what it legal here. No doubt your folks also have different specific rules, you'd need to look them up. And FRS typically uses a 2.5MHz signal half the width of 2m FM, much more tightly frequency controlled as well.

From one point of view the APRS "tones" can just be called "music"....which is legal to transmit on some services, even when "data" isn't.<G>

Although I'm not sure why you'd want to waste good Rino's with their own positioning system on APRS use.

It isn't a waste to use the GPS functionality of the Rino with APRS, if that is your GPS receiver of choice. The peer-to-peer positioning capability of Rinos is pretty cool, but very limited. Limited by distance, limited by wattage, limited by the lack of repeaters, and limited by the fact that you can only use it with others that also have Rinos. I often use the FRS peer-to-peer positiong on the Rino when there's a group of us (all with Rinos) in a fairly limited area, and it works great for that situation.

When I first got into APRS, I used a Rino for its GPS functionality, and it worked just fine.

1661. Transmit antenna/GPS antenna separation question

Yahoo group: APRS (1998 — 2006)
Date: 2004-05-05 22:36:48 UTC
From: vesterscott
Topic: 1661 Message: 1661

How close to a mobile GPS antenna can I place a vertical mobile antenna transmitting a kilowatt in the 1.8 to 29.7 MHz amateur band without frying the GPS antenna? I'll have two GPS antennas in operation--one for navigation and the other for APRS/tracking.

Motorola rates their old "ANT" series actove GPS antennas as follows: "BURNOUT PROTECTION: Protected from damage by RF signals when the power receive [sic] by the antenna is no greater than +17 dBm absolute maximum." Unfortunately, my calculator will not convert this to feet and inches.

I'm hoping Moto meant RF signals on or near the GPS operating frequency, and that the 1500 MHz difference in operating frequencies will allow me to space them as close as two feet. Or,is there some kind of brute force factor involved here that is frequency independent? I don't care if the GPS Rx temporarily loses it's mind when I'm transmitting--I just don't want to have to replace the GPS antenna every time I operate HF.

Any ideas/advice?

73,

Vester N8EKA

Vester,

Here is my S10 Pickup Trucks configuration...

2M and Cell phone through the glass antennas on the back window.
Hustler MO2 with KW resonators in the middle of the gull wing Tool Box. (Just behind the 2M and Cell phone)
I run about 500 watts...

When I run APRS, which is a temporary install...
GPS antenna (The receiver circuit is the antenna by the way, looks like a pc mouse) on a magnetic mount by the 3rd door near the window.
Just behind the drives seat where wires come through the side window.
I have the 2M Magnetic mount transmitting APRS in the middle of the roof towards the front.

I would say HF antenna is about 6 feet if you drew a line to the GPS Antenna.

I talk on HF and while talking to stations I tell them to go to my website, and they bring up my information from the web with no problems.
So hope this was some help...

Keith, K4KAL

That helps, Keith. Thanks.

If it functions normally for you at six feet separation with 500W HF, then it might SURVIVE 1kW at the same distance. I can actually achieve 6-8 feet if I put the GPS antennas near the vhf/uhf antennas (50W stuff) towards the front of the van. OTOH, 2 feet would be better from a cable routing standpoint. And, the GPS antennas might tolerate HF better than vhf/uhf.

Sure would be neat to fimd a comprehensive study that some erudite ham has already done on this, wouldn't it?

From: KC2MMi
Topic: 1657 Message: 1665

Jim, I don't understand how you use the Rino "with" APRS. If you're using the Rino as a dumb GPS...I don't call that using it with APRS. If you're using the Rino "with" APRS in the full sense of the word, sending APRS tones over the radios with TNCs and making the Rino an integral part of things...that's the part where I don't know if that's a legal use or not.

Or are you using a network of Rino's and then using one of them as a gateway to send all the information into an APRS system? Give us all a hint, my telepathy is getting jammed today.<G>

Vester, I think the answer is going to depend on details and you may have to try boosting tx power until you see interference...and if possible monitor the GPS in the assumption that it will not burn out as long as it is still functioning, i.e. receiving properly.

Would it make any sense to shield the GPS by placing grounded copper screening or baffles over it? Something with a spacing that would still allow the GHz satellite signals to be received "well enough" but would act to block enough of the HF? Would window screening attenuate the HF enough, while allowing the GPS to see the sky well enough to work? (Or am I getting my frequencies and sizes backwards?<G>)

Needless to say, putting the GPS antenna as far away from the HF as possible probably will be the biggest single help. Kilowatt output...and you're essentially located at the tx antenna yourself??
